

your System Tray to show the controller menu. If 'Automatic Receive' is enabled, faxes will be received automatically. If it is unticked, you'll have to right-click the System Tray fax icon, and click 'Manual Receive Now' or go to *Receive > Manual Receive Now* in the Message Manager window to receive the fax.

You can customise the fax receiving settings even further by going to *Start > Programs > Symantec WinFax Pro > Program Setup > Receive* and then selecting Properties. Use the options in the General tab to specify the number of rings after which the call should be answered. Specify the time when you want calls to be answered automatically by clicking on Schedule.

Decide the action that has to be taken after a fax is received, such as playing a

sound or printing it, in the 'After Receive' tab. In the 'Junk Fax' tab, you can specify what to do with junk faxes—faxes with a missing or incorrect CSID. In fact, there are lots of features that can be customised in WinFax Pro. For this, you will have to go to the Program Setup located in the *Start > Programs > Symantec WinFax Pro* group.

Here, you will find options for backing up and restoring your faxes and logs, and other things. That's the way you get your PC to double up as a fax machine. You can also try setting it up using faxing software that comes with the MFD driver installation CD.

These software have made faxing less of a tedious job. So the next time the boss needs to send something urgently, all you have to do is use the PC!

## Workshop: Batch OCR using ADF

Scanning multiple documents and running them through OCR software one at a time can be time consuming. To speed up this process, you can get OCR software that has a batch feature. Using this feature, multiple documents can be scanned and OCR'd without wasting time.

To use this feature, the MFD must have an Automatic Document Feeder attached to the scanner. The capacity of the ADF will decide how many copies can be scanned in one shot without user intervention. We used ABBYY FineReader 6 CE for this workshop—it has the batch feature. Here are the steps to get the batch feature work for you.

Scan all documents as an image into a folder using the ADF. Go to File and click New Batch. Now, create a new batch on the hard drive.

Open this batch by going to *File >*

*Open Batch*, and in the dialog box that opens up, select the batch folder from the location. Now click 'Open Image' and click 'Open Image' again. This will open up the dialog box from where you can browse to the batch folder where the images were saved.

Select all the images to be OCR'd. Once the files are selected, open them all—they will show up on the left of your. Click the 'Read all' button, and sit back while the images are read by FineReader.

Once the recognition part is over, click Save, which will present you with the option to save the document as Microsoft Word, Excel, or text. Choose the file format, and all documents will be saved accordingly.

If you have fewer documents—10, for example—then there's a feature called Scan and Read Multiple Images. Using this feature, you can scan the documents in the ADF, and FineReader will read the scanned images.

The Save Wizard lets you choose the format in which you want the file to be saved

Professional, fast & efficient.

HP OFFICEJET 6110 ALL-IN-ONE  
PRINT, FAX, SCAN COPY  
**Rs. 18,999\***  
Up to 4800-optimised dpi†
