

Ontrack Quick Cleanup removes junk files, cookies and unnecessary files

Applications that do not have their own uninstallers can be removed using CleanSweep's Uninstall Wizard. You should use the Uninstall Wizard even for applications that do have their own uninstaller, because CleanSweep does a better job of uninstalling a program. Go to *Norton CleanSweep > Cleanup > Uninstall Wizard*, and you will see programs that do not have uninstallers.

Select a program you want to remove, and click Next. You are given an option to back up the program, in case you change your mind later and want the program back. Select Yes, and choose the directory to back up to.

Now, you will be offered the option of manually choosing which files to delete, choose No, and click Next. The last screen will show you the total amount of data, in bytes, that will be deleted, and a list of the selected files—you can choose to keep certain files by de-selecting them. Click OK to return to the main window, and Finish to uninstall the program.

Ontrack System Suite: With Ontrack System Suite, you can go to 'One Stop Solutions' and select Cleanup for a totally automated sweeping of the Registry, Temporary Internet Files and other unnecessary files from your system.

Click Next to see a log of the files cleaned. Click Done to close the window.

In the Cleanup section, you can manually select the files you want to remove—choose from Internet Cache, Internet History, Internet Cookies, ActiveX, Plug-ins and QuickFileClean. Click on QuickFileClean, and choose to empty the Recycle Bin, and delete the Web Cache, Web History, Lost Clusters, Temporary Help files and Broken Shortcut files. Clicking Next will start the scan, and you'll get a report of all files cleaned. Click Done to close the wizard and return to the main window. Similarly, run all the other wizards for a thorough cleaning.

Ontrack has in-built sub-applications, each performing a specific task. For example, the Uninstall module uninstalls applications, and other modules perform tasks as varied as moving programs to different folders, or even a different computer, backing up an application and archiving it. The archive feature creates a compressed backup of an application before uninstalling it.

The first time you run the program, Ontrack analyses your computer and your files to create a log of files linked to specific programs. Once this is done, it'll show you a list of programs sorted by categories such

Momentus
The First 5400-RPM Notebook Drive to Combine
High Performance With 4200-like Power

- Harness the power of experience, commitment and innovation from the industry's only independent supplier of notebook drives
- 40 and 20 Gbytes, 2 and 8 Mbytes option
- 5,400 RPM, 2.5-inch Notebook

Data Destroyers

The most common reasons for data loss are:

A virus attack: Many viruses are notorious for deleting files. Some try to delete or overwrite the partition table, which tells the OS about the start and end locations of the data partitions on the disk.

Accidental deletion of files: This is a very simple reason for data loss: the user deletes important files without moving them to the Recycle Bin first. The user may also

delete files from the command prompt, or through applications that do not utilise the Recycle Bin, for example, WinRar.

Physical problems with the hard disk: This is by far the most common reason for data loss, and also the most difficult to remedy. Hard disks can develop a multitude of problems, starting from faulty read and write head alignment, to a badly damaged head glued to the disk platters due to stiction (static friction).
