

Security Watch

W32.Beagle.AG@mm

Also known as:
WORM_BAGLE.AH,
W32/Bagle.ai@MM

Infection Method: This mass-mailing worm uses its own SMTP engine and opens a backdoor on TCP port 1080. It sends e-mails to addresses found on the victim's computer. These include attachments that have .com, .cpl, .exe, .scr, or .zip extensions. The 'From' address is spoofed. It also copies itself to folders that have 'shar' in their name. It uses fake file names (ACDSee 9.exe, Porno Screensaver.scr, etc) to fool the user into executing it.

Damages: It generates a flood of e-mails, and thus slows down the PC, clogs mail servers and degrades network performance. It also kills processes associated with anti-virus applications.

Removal Instructions: Download its removal tool from <http://security.response.symantec.com/avcenter/FxBeagle.exe>. Close all applications, disconnect the system from the network, disable 'System Restore' and run this tool. Reboot the computer and run the tool once more.

would incorporate some of this.

In addition to this, Yahoo! offers RSS newsfeeds, which Google does not.

So what's next? Yahoo!'s Content Acquisition Program (CAP), of course. Yahoo!'s CAP plans to map the deep web, or the invisible web, the part of the Web currently uncharted by crawlers. What Google will do about that remains to be seen.

SMART PHONE

A phoney future

We knew this was coming. "All the credit cards, keys, money-all that

stuff in a purse or wallet-should go into the phone," Takeshi Natsumo says. "By having the phone with you, you shouldn't need anything else but your clothes." Natsumo, MD for i-mode strategy at NTT DoCoMo, the biggest cell-phone company in Japan, is talking about

DoCoMo's plans for a new smartphone.

i-mode, DoCoMo's wireless Internet service, is planning on nothing less than a phone that will act as a remote control for your life. This "remote control" will include cash, credit cards, other commercial cards, driver's license, business cards, bank documents, cheques, and even your house and car keys. Sounds futuristic?

But that's exactly Natsumo's vision for right now. The phone will feature a Sony chip, called 'Felica', that lets it pay at checkout counters, serve as personal identification, unlock doors, operate household appliances, and buy various kinds of tickets, amongst other tasks.

DoCoMo's first target is Japan's railway stations, which house restaurants, department stores and more. In addition to stores, the Felica phones can replace the cards that Japanese currently use to move through turnstiles.

Naturally, such ubiquitous computing has its perils: what if a phone is used by a hacker to "download" money from another person's phone? Also, DoCoMo will have access to too much info about a customer. It is fear about such issues that may delay mass deployment.

By the way, read our feature 'Good-bye laptop,

DoCoMo's wireless service, i-mode, is set to come up with a phone that plays remote control for your life

HOT

MFDS

Why buy many, when one will do! Multi-functional Device (MFD) sales are on a rise as users are preferring a single-point solution for their scanning-printing-copying and faxing needs.

NOT

Low-end Scanners

Entry level scanners that served us faithfully all these years are being pushed to oblivion by printer-scanner-fax-photocopier combos that save money and desk space.

Hello Smart-phone' in Digital Passion to get an idea of what the future smart-phone can do.

PRIVACY MATTERS

Darling, may I read your e-mail?

In privacy-crazy America, a new ruling by a Boston federal appeals court may seem outrageous. It ruled that e-mails may be read by anyone, without a search warrant.

The court ruling says that if an e-mail has been stored on a server for even a millisecond, then, ostensibly because it's not entirely yours, the privacy that you assumed the e-mail should be accorded does not exist.

There's also a difference

One Silly Question

Which browsers do you know and prefer?

I prefer IE because it's like a phone number. I'd never want to change it.
Rajat Mishra, Bangalore

IE, MS Explorer and MSN Explorer. I use IE. It's easy to use.
Ashwini Ramakrishnan, Navi Mumbai

IE, Opera, Netscape. I prefer IE6 as it's user-friendly. Opera isn't for first timers.
Sachin Chandna, New Delhi

I know only IE and Netscape. But I prefer Internet Explorer.
Laxmi Ravikumar, Chennai

I only know IE and Netscape. I prefer IE because I am used to it.
Priya, Mumbai
