LinkedIn
 Find the people you need through the people you trust

Want to tap the true power of the professional network you already have?

Your trusted friends and colleagues can help you in touch with many more people than you expect, and those people can refer you to thousands of contacts.

That means you can find jobs, locate employees, and close deals faster and more reliably than ever before.

Start your Network

LinkedIn.com

What is LinkedIn?

How many people in your phonebook? 50? 350? Maybe, even a thousand. How about increasing that contact list to more than a few thousand—from across the world. LinkedIn allows you to do just that. It is safe too, since new contacts are made only through trusted connections.

Who founded LinkedIn?

Reid Hoffman is the man behind LinkedIn. Currently on the board of directors of four other business consultancies and Web sites, Hoffman is also an angel investor with interests in several sites.

When did LinkedIn begin?

Interesting story. Sometime in 2002 LinkedIn's founder Reid Hoffman spent five days looking for a Flash designer for his erstwhile company PayPal. None of his contacts could send him the ideal person. Finally, a colleague suggested her friend's friend for the job. Hoffman knew the time for a networking site had come.

Why choose LinkedIn?

In one word—credibility. Very few sites have earned the trust of its users, and LinkedIn is one of them.

Where is LinkedIn located?

Close to our best online friend, Google, at Mountain View, California. Networks are spread worldwide.

How do I use LinkedIn?

Create a profile on LinkedIn just as you would create a profile for an online email service. A profile allows you to search for people connected to your through your network for job listings, mentoring, financial services and venture capitalists from different countries and sectors.

used to allow caches to automatically “evolve” their configuration. “Further development could involve different rules suited to each individual host or subnet involved in the internet,” says Pablo Funes of the University of Karlsruhe. “One can even imagine each host evolving its own optimal rule.”

DVD COPYING

Sharing is not loving

Marking a shift in the way the movie industry has reacted to the threat of online piracy, a group of media and technology companies, including Microsoft and Disney, have agreed to allow consumers to make legal backup copies of “next-generation video discs”, and share the content on portable devices. Next-generation DVDs will deliver superior video and audio, although technology and media companies haven't yet reached a consensus on which competing DVD format will prevail.

The announcement comes in the wake of all the hubbub about piracy, file sharing and copying of media.

The group of companies also includes IBM, Intel, Matsushita Electric Industrial Co. Ltd. and Warner Bros.

Today's DVDs are protected by the CSS (content scrambling system), which prevents copying. The computer and consumer electronics industry have pushed to allow easier, more seamless sharing of media between TVs, computers, and portable players. The alliance has named its yet-to-be-developed content protection technology “Advanced Access Content System (AACS).” The system will be available for licensing

later this year.

The new AACS system is logical. If you have a DVD, it should be legal to have a backup of it on your hard disk, just as it's legal to have a backup of a cassette tape. But it's anyone's guess what this move will do for DVD piracy, and how far it will be successful in maintaining legitimate use of copying facilities.

INDUSTRY

Shalom, India!

Intel and Motorola might leave Israel in favour of India and China as their new international hubs, Gartner's Israeli representative said in Jerusalem last month.

Baruch Gindin, Gartner's Managing Director for Israel and West Asia, has warned Israel's Knesset Science Committee that there is a serious risk that the two companies might leave Israel in favour of the “better” and “thrifter” alternatives offered by India and China, Israel's Maariv International magazine reported.

This seems to be an issue of serious concern in Israel right now, because of the contributions that the two companies currently make to the Israeli economy.

Although nothing is confirmed as yet, India

could well benefit from the extremely strict tax laws in Israel. India could also benefit because of its cheap labour.

A new report, released in July, indicates that the world semiconductor industry is expected to record a 50.9 per cent increase in financial expenses in comparison with 2003, with equipment expenses surging by 63.5 per cent. Gindin made his remarks in reference to this report.

Gartner has recommended that the Israeli government resolve this problem by changing tax laws, and by launching a global campaign highlighting the advantages of the prospective scene in Israel.

Israel is deeply entrenched in the semiconductor industry. It also designs and manufactures

machinery used in the manufacture of semiconductors. The shares of 140 Israeli companies are traded on the US stock exchange.

This is rated as the highest from any non-North American country. So why the proposed shift to India?

Apart from tax laws and cheap labour, these companies also have a wider talent base to choose from. It remains to be seen whether the Israeli tax laws will be changed soon, and whether, therefore, this is the beginning of a trend—and in the meanwhile, Indians can look forward to more jobs. ■

Intel and Motorola, who may leave Israel soon, are eyeing to set up hubs in India and China
