Creating Styles

Using styles for formatting is recommended over changing formatting parameters like fonts, para-

graphs space for individual chunks of text. This allows you to format faster and also brings consistency across the document. To create a new style, select the text that you have formatted and want to use as 'style'. Go to **Format > Styles and Formatting**. This will open the Style and

Formatting task pane in Word 2002 or later. Click New Style in the task pane and in the dialog that comes up, enter the name of the new style. Change other options if you want to, and click OK. You can apply the style from the Styles dropdown list on the Formatting toolbar.

More text in less space

You can fit in more text in lesser space in several ways. Perhaps, the most obvious one is to reduce the font size. However, don't make it too small that it becomes unreadable. As a rule of thumb, anything below 9 point is a no-no. However, you can accomplish tighter text also by reducing the line spacing to single, making indents paragraph spacing zero. You can get to all these using the **Format > Paragraph** dialog.

Using a Table of Contents

A table of contents comes in handy when navigating within a document—especially long documents. It creates and maintains internal hyperlinks based on the formatting styles used in the document. Make sure you format the document using the styles—Heading 1, Heading 2, etc. Now, move your cursor to the

Justify text beautifully in MS Word

When you apply Justify formatting to a paragraph, Word inserts spaces to adjust the length of the line. Sometimes, you may end up having too much white space in between words. To achieve alternative and more presentable text justification, go to **Tools > Options** and click the Compatibility tab. In the Recommended options for list, click WordPerfect 6.x for Windows. Then enable the checkbox Do full justification like WordPerfect 6.x for Windows under the Options. Click OK to close the dialog. This spacing adds and removes spaces, which normally results in uniform spacing.

beginning of your document by pressing [Ctrl] + [Home]. Go to **Insert > Reference > Index and Tables**. In the dialog box that pops up, go to the Table of Contents tab. Click on the Options button, and make sure all the heading levels you have used in the document are selected. Click OK to come back to the Index and Tables. Now choose the number of levels you want to appear in the TOC and click OK to create the table of contents. You will have to press [Ctrl] and click the hyperlinks to follow them. To go back to the TOC, click on the 'Go to TOC' button on the Outlining toolbar.

If you are using Word 2002 or later, there is a simpler way to navigate within a large document. Simply click **View > Document Map** and the map of the document, similar to Windows explorer, will open on the left side of document window. You can then click the heading in the document map to jump to that section. It's better to use

MS PowerPoint

than TOC in many cases. **Use Outline for entering content quicker**

Tackling both the look and typing the content for a presentation at the same time can be a bit overwhelming. Why not try getting your thoughts down first in the Outline view and then build from there? In the left panel of the PowerPoint window, click the Outline tab. Type your thought and press [ENTER]; that's a new slide title. You can continue creating slides and entering slide titles by typing information and pressing [ENTER]. If you want to add content to a slide, press [TAB] (instead of [ENTER]) and PowerPoint records the text as a bullet point. To add a bullet within a bullet point, press [TAB] again. You can create several levels of bullets, but usually one or two levels do the trick.

Template for repeated presentations

If you are creating the same presentation layout over and over again, you can turn your presentation into a template that you or others can use fast and flawlessly. A template saves all the settings you have selected—background images, colour scheme, font selections, and so on—and ensures that the presentations you create based on that template all have the same elements in common. This is great if you have a uniform companywide look that you want all your departments to adhere to. To turn a presentation into a template:
