

subject, already filled in. All you need to do is choose which criteria to use and which action it should trigger. And enter data in steps till 'Finish'.

Categorise to Track Data

 Categories help you manage your data from various sources, but is a very under-utilised feature of Outlook. Each Outlook item can be assigned a category, either from the Outlook's default set, or a custom one. Assign your e-mail, meetings, journals entries, tasks etc. a category, so that later, you can easily retrieve all data related to a particular category, such as of your clients' names.

Categorising to organised data

To categorise an item, right-click the item, and then click Categories. This will bring up your current list of categories. Select a category from the Available categories list. To create new categories, click Master Category List.

To view all the items that belong to that category, you can customise your view to group items by category. Or use Advanced Find to search

Bet you didn't know

Delete Duplicate Rows in MS Excel

To delete duplicate rows, you filter a list for unique rows, delete the original list, and then replace it with the filtered list. The original list must have column headers.

1. Select all the rows, including the column headers, in the list you want to filter.
2. On the Data menu, point to Filter, and then click Advanced Filter.
3. In the Advanced Filter dialog box, click Filter the list, in place.
4. Select the Unique records only check box, and then click OK. The filtered list is displayed and the duplicate rows are hidden.
5. On the Edit menu, click Office Clipboard. The Clipboard task pane is displayed.
6. Make sure the filtered list is still selected, and then click Copy. The filtered list is highlighted with bounding outlines and the selection appears as an item at the top of the Clipboard.
7. On the Data menu, point to Filter, and then click Show All. The original list is re-displayed.
8. Press the [DELETE] key. The original list is deleted.
9. In the Clipboard, click on the filtered list item. The filtered list appears in the same location as the original list.

Caution: Because you are permanently deleting data, it's a good idea to copy the original list to another worksheet or workbook before using the following procedure.

for all the Outlook items related to a category.

In the Tools menu, click Advanced Find, and then click the More Choices tab.

Click Categories and use

the Available categories list to select the categories you would like to find. Click OK. Then go to Find Now.

Search all Info Related to a Contact

 Few people ever venture past the first tab in the Outlook Contacts form. After all, if you are storing information for business contacts, just about everything you need is contained on the first tab. Occasionally, you click on the second tab to enter a spouse's or assistant's name. But have you ever seen what the third tab, the Activities tab, contains?

The Activities tab shows you all the Outlook items related to that contact: every e-mail, meeting, journal entry, or task. It's a great way to review all your communication with someone or prepare for a meeting with them. If you're overwhelmed by the sheer volume of information on this tab, you can filter the information and display only Contacts, E-mail, Journal Entries, Notes, or Upcoming Tasks or Appointments.

Create a virtual business card

 Use Outlook to extend the ritual of passing out business cards. Add a virtual business card (vCard) to your e-mail signature, ensuring that your business contact information is included in each e-mail message you send.

To include a vCard with your e-mail signature:

1. On the Tools menu, click Options, and then click the

Mail Format tab.

2. Under Signature, click Signatures, and then click New.

3. Select the options you want, and then click Next.

4. Under vCard options, select a vCard from the list or click New vCard from Contact.

MS Access

Archiving Stale Records

 If you have a large database, with records you do not query regularly, shifting them to a new table will improve the efficiency of your table. We will hence archive records from one table to another. You archive records (instead of deleting them) when you want to remove unnecessary records from the original table to reduce its size. To archive records in an Access database (.mdb), build simple queries that move the records from one table to another. A macro can be used to automate the multiple queries used to accomplish this task.

To periodically archive records from one table to another:

1. Use the Copy and Paste commands to make a copy of the table you want to archive. Copy only the structure, not the data. For example, copy the structure of the Products table in the sample database to a new table called Products_Archive.

2. Create an append query that contains all the fields in the original table and appends records to the archive table. Set the criteria to specify the subset of records you want archived. For example, create an append query called Products_Append that appends only discontinued
