

THE CHALLENGE

Replace the default Microsoft Windows XP "Copying..." animation

Each month, Digit will pose a query that will set you thinking. The challenge is to crack it. If you are successful in cracking the challenge, send in your answers to Digit with your full name, your address and other contact details to takeacrack@thinkdigit.com.

Digit's Test Centre will select the correct answer(s). In case of multiple correct entries, the winner will be decided by a draw of lots.

Last Month's Challenge Was

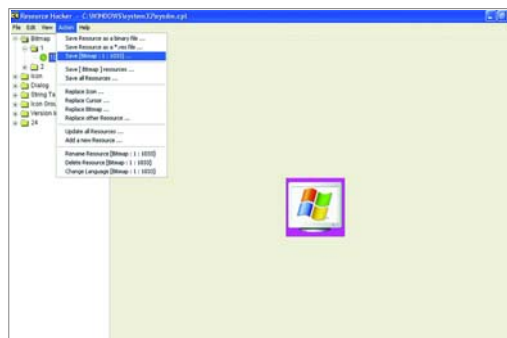

Replace the Windows XP logo in the General tab under System Properties with an image of your choice. The winner of the Microsoft keyboard and mouse is Amit Bhagat. Congratulations, Amit! His solution is published below ...

The Solution To Last Month's Challenge

Here's how to replace the Windows XP logo in the General tab under System Properties.

1. The Windows XP logo is controlled by the file `c:\windows\system32\sysdm.cpl`. We'll need to edit this first, for which we need a tool called Resource Hacker. This can be downloaded from <http://www.user.on.net/~johnson/resourcehacker/>.
2. Back up the file before proceeding.
3. Start Resource Hacker and open "`c:\windows\system32\sysdm.cpl`".
4. Expand the "Bitmap" folder, then expand the one folder there, and click on "1033." You'll see the Windows XP logo in the right pane.
5. Go to Action > Save [Bitmap: 1:1003] and save the bitmap image. Do not close Resource Hacker.
6. Open the saved image using any editor, and note its size. Now create an image of your choice of the same size and save it.
7. Now in Resource Hacker, replace the image with the edited image. Save it from File > Save As, in any location except `c:\windows\system32`, with the name "`sysdm.cpl`".
8. Restart your computer in DOS mode and copy your edited "`sysdm.cpl`" file to the `c:\windows\system32\` directory. Say "yes" when asked to overwrite the existing file.
9. Restart your computer and note the results.
10. To get your old logo back, just replace the "`c:\windows\system32\sysdm.cpl`" file, under DOS mode, with the original "`sysdm.cpl`" you backed up earlier.
