

Let's Meet Online

How real-time video sessions take place over an ISDN line or broadband connection

What You Need:

Cameras

One or more webcams or small video cameras, with video input connections

Speakers

To receive audio input from the client's end

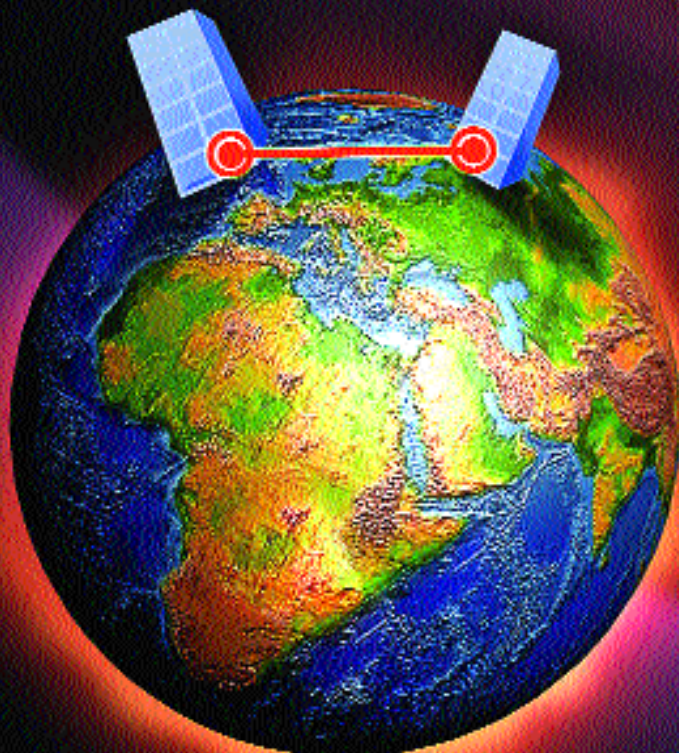

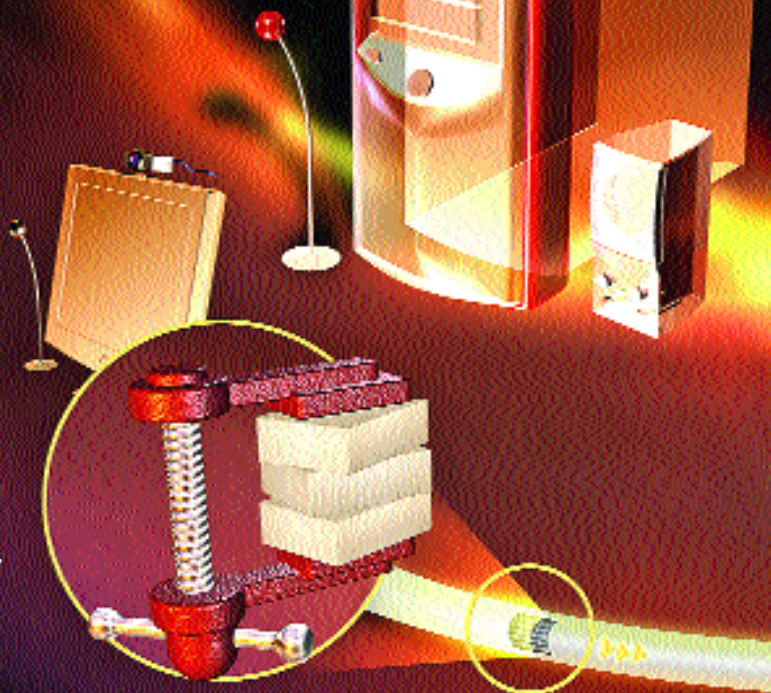

A Microphone

To enable audio input

A LAN Card

A Network Interface Card connects your PC to a LAN, which provides access to a broadband connection. Else, connect directly to a dedicated ISDN line.

1 Videoconferencing Sessions

Can take place between clients in different rooms within the same premises, different offices within a city, as well as in different countries. In a multi-party session, a multipoint control unit (MCU) is used to mix the audio and send the video of the predominant speaker to every screen. Like a telephony PBX, a video PBX is used to switch calls and provide call forwarding and call transfer.
