

The mWallet:

Pay over the air!

Say goodbye to credit cards, ATM cards and passwords.
Your mobile phone can now double up as your wallet!

[2] Data Transfer: Bluetooth, IR, SMS

Users need to point the mWallet-enabled phone or PDA at a Point of Sale (POS) machine, and click on the relevant tab. Alternatively, you can send an SMS to your bank to authenticate your password and user ID. In the case of Standard Chartered's OneWallet service, the POS machines (which swipe credit cards) are fitted with an infrared (IR) adapter. The adapter converts the IR beam from the mobile, to a series of magnetic pulses that replicate the swipe of the card through the slot. Once your account has been authenticated, the transaction is complete and an invoice will be printed.

Shopaholics need not worry about paying by cash or credit card. You can now use your smartphones, PDAs or Tablet PCs in place of your credit card. Standard Chartered's OneWallet software, for example, can be installed on any J2ME or smartphone. Create a Virtual Wallet to store virtual debit or credit cards, ID Cards, tickets and other info.

[1] Authenticate Your mWallet Account

Once the customer installs the mobile wallet software on his phone or PDA, he receives a code and password from the bank. The mWallet software is authenticated by the bank's server via GPRS, which allots a private digital key to the client's application. The mobile wallet is now ready to use.
