Tomorrow

Prototypes Today, Gadgets Tomorrow

As always, the technology that we find cool today will hardly be given a glance tomorrow. *Digit* plays soothsayer and predicts what the personal gadget of the near future will look like...

Robert Sovereign-Smith

The lines between functionality of gadgets are being blurred. Remember the days when savvy executives were seen walking around with so many gadgets strapped to their belts that they looked more like handymen than executives? A walkman for aural entertainment on the move, a pager to keep in touch with the office and a digital diary to store their contacts...

Fast forward a few years into the present, and the story isn't too different. MP3 players are about the size of a matchbox, and a lot easier to carry around than the huge walkman of yore. Pagers are *passé*, as the latest mobiles come equipped with cameras, address books and basic PDA functionality.

An addition has been the laptop, which is a lot bigger than anything we would carry around earlier, but about as essential to our fast-paced lives as our kidneys.

In essence, we're having to lug around a lot more gadgets, and as a result, more weight than we did before. Hopefully, this won't last for long and technology will find a way to bring relief to our aching backs.
