

a handy search box that puts search engines at your fingertips. When you download Firefox, some searches such as Google, Yahoo!, and eBay are included, and you can easily add more. There are hundreds of search engines available. Some of the most popular are A9, AltaVista, AskJeeves, IMDb, Merriam-Webster, and Wikipedia.

To add a search engine, click on the current icon in the box, then click 'Add Engines...'. You'll be taken to Mozilla's page for available engine plug-ins. Simply follow the directions on the page, and your engine will get added instantly for you to use.

Add Google Desktop Search To The Engine Box

Go to www.amwmedia.com/?nId=17. If you use Google Desktop Search (GDS), you'll want the plug-in available here. It allows you to add GDS as one of the search engines. Additionally, this little plug-in will help you get around the current 10 results per page that GDS imposes. Simply follow the directions on the page to install GDS into the search box.

Remove Engines From The Engine Box

Go to "C:\Program Files\Mozilla Firefox\searchplugins" (or wherever Firefox is installed). Each engine you have installed has two files—a .src file and either a .png or a .gif file. All you have to do is delete the two files for the engine you wish to remove—for example, google.src and google.gif. Close and restart Firefox for the change to take effect.

The Google Toolbar For Firefox

Google recently released their Google Toolbar for Firefox, and if you're a fan of Google and use its services for almost everything, you may want to install it. Not only does the toolbar allow you to search through Google's various search engines, it also comes with auto-fill functions, Froogle searches, dictionary and stock

referencing, the page rank feature, and more. The toolbar even integrates with Blogger, and offers some basic translation features.

Get it at <http://toolbar.google.com/firefox/>.

Installation is simple, and it works like any other Firefox extension.

Live Bookmarks

Live Bookmarks in Firefox let you view RSS news and blog headlines in the bookmarks toolbar or bookmarks menu. With one glance, you can quickly see the latest headlines from your favourite sites. You can go directly to the articles that interest you, which saves you time.

A site is enabled for Live Bookmarks when you see an orange RSS icon on the bottom-right corner of the browser. Clicking on the icon and selecting an RSS feed will bring up the 'Add Bookmark' dialog. Select 'OK' and you will see Live Bookmarks with the rest of your bookmarks. You may find it especially convenient to save Live Bookmarks in your Bookmarks Toolbar folder.

Add Live Bookmarks Manually

Some sites don't tell Firefox that they support Live Bookmarks, even though they actually do. If you know the URL of a site's RSS feed (the URL will end with .rdf or .xml), you can manually create a Live Bookmark for the site. Go to the Bookmarks menu and select 'Manage Bookmarks'. Under the 'File' Menu, select 'New Livemark'. Create a name for the Livemark and add the URL. New articles from that site will appear as Live Bookmarks in Firefox.

A Firefox Tab-Switching Shortcut

Did you know there's a keyboard shortcut to switch between tabs in Firefox? Simply type in [Ctrl] + [#], where [#] is the tab number (so it's 1 for the first tab, 2 for the second, and so on). This only works with up to nine tabs, but that's probably enough.

Opera

Scripting Errors

If you get errors on Web pages, or if they're displayed in a weird way, it could be a scripting error. Opera uses Netscape features by default; it doesn't run JavaScript but JavaScript instead.

You can force Opera to behave like Internet Explorer while viewing Web sites. Press [F12] to get the Quick Preferences pop-up and select 'Identify as Internet Explorer'.

The Autofill feature

Opera allows you to fill up standard information such as your name, address, phone number, e-mail address,

select 'Properties'. After the text already there, which simply tells the computer where Opera can be found, just add your pages, thus: "http://www.thinkdigit.com" "http://www.thinkdigit.com/forum" "www.cnn.com" "www.opera.com"—making sure to leave a space between each page address, and making sure each page is enclosed by double quotes, not single quotes.

Clear The Cache With A Single Click

To insert an item in the right-click menu to delete the contents of the cache, find and open the 'menu.ini' file and search for

etc. without having to type these in every time. Open Tools > Preferences, click on the 'Wand' tab, and fill out all the details. To enter the information into a text box on a Web page, right-click the text box, go to 'Insert Personal', and choose the text you want to input.

Always Start Browsing With The Same Set Of Pages

If you always start browsing with the same two or three pages, there is a way of always opening Opera so that those pages open automatically. Right-click the Opera desktop shortcut and

the following lines in the [Browser File Menu] section: Submenu, 162000, Quick Preferences Menu = Show popup menu, "Quick Preferences Menu" Item, 50394 = Show preferences, -1

Here, add the line: Item, 54493 = Delete private data

Save and close the menu.ini file.

Enable Scrollbar Colours

To enable colours in the scrollbars, add the following lines to opera6.ini in your profile folder: [User Prefs] Enable Scrollbar Colors=1
