

The external style sheet is something you will create as a separate file and then link it to your Web page. An embedded style sheet is, as the name goes, embedded in the Web page, and this software will let you create one with a wizard as usual. It's highly effective and accurate; however, you do need to have some degree of coding knowledge for this.

Simply click on the CSS tab at the bottom, and then on the left pane, click on 'New Webpage', and then on 'Embedded Style'.

If you already have a page open, simply click on CSS, and then on 'Embedded style' to add it to your page. To add various properties, simply click on them on the left and then follow the wizard yet again—and you'll be done in no time flat.

6 STEP Uploading Your Web pages

Once you're finished with the various settings, text and the style sheet implementations, it's time to upload your page for the world to see it. NoteTab Pro will let you upload the file from within the program. You simply need to configure the FTP settings.

Click the 'FTP' tab at the bottom, and then on 'Server Setup'.

Again, you will be presented with a window asking you for the various settings for your server. Enter these settings and you're on your way to uploading your Web pages—but this is where we hit upon a snag in the software.

Note that you're provided with the server settings when you sign up for Web space, or if you are hosting it on a free server such as Geocities, the settings would probably be in

the confirmatory email they send you. In its free avatar, Geocities does not support FTP.

When we clicked on 'Upload', we were presented with a wizard as before, but at the bottom where we were supposed to enter the files to be uploaded, we just got a blank text box expecting us to type in each file name! This is a serious shortcoming in an otherwise brilliant piece of software.

Apart from the glitch in the FTP aspect, this software will let you do almost all kinds of HTML coding including CSS, and is an extremely powerful tool even if you swear by Dreamweaver.

NoteTab Pro is lightning fast, and produces excellent results with just a few clicks.

If you want to learn while you make Web pages, this is the software that will let you do it!

Of course, there are tons of other features—find them for yourselves right away!

7 STEP Adding Images

Adding images takes a single click, which gets you to the now familiar options menu where you can specify the alignment, borders, spacing as well as an alternate text.

8 STEP Frames

Although we do not recommend the use of frames in your Web site, due to compatibility issues across browsers. However, if you choose to use frames, this software will help you tremendously. You can create frames at the click of a button, and the options available are amazing. You can create an iFrame (a frame containing dynamic content) or

even specify what the browser should display when it does not support frames.

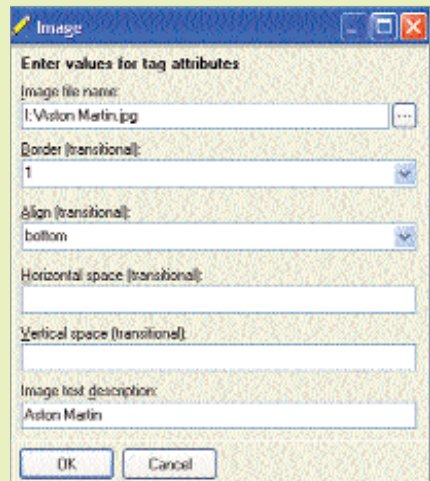

9 STEP Creating Forms

If you would like to get feedback or conduct a survey, the best solution is to use a form.

This software excels in this regard, and the drop down menus take away the need for coding knowledge—just pick and choose whatever is required.

You can configure the Input type, the default text in the box as well as the name of the box (very important in form submission)

It will also let you change the input type from a box to a radio button, or even a check box! All with a couple of clicks,

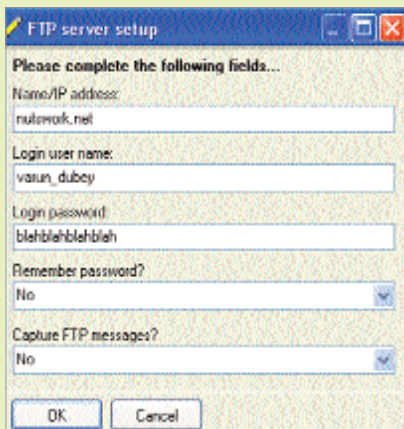

Embedding images into a web page was never so easy

10 STEP HTML Cleanup

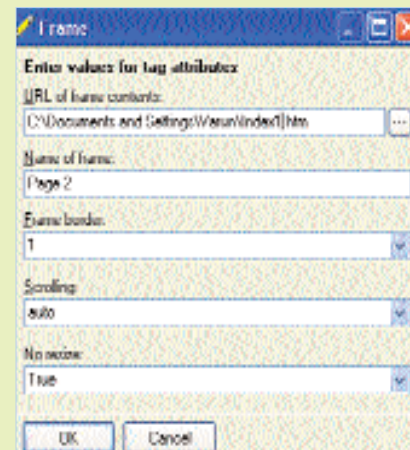

What's more, if you mess up with the code, the software can fix it automatically. There is a single click option called "Clean Up HTML" which cleans up any un-ended or orphan, and empty or redundant tags, which ensures better compatibility across browsers.

Apart from the glitch in the FTP aspect, this software will let you do almost all kinds of HTML coding including CSS, and is an extremely powerful tool even if you swear by Dreamweaver. NoteTab Pro is lightning fast, and produces excellent results with just a few clicks. If you want to learn while you make Web pages, this is the software that will let you do it! ☑
