

that arrives from now on' is checked. (Choose 'Enable POP for all mail' if you want to download mail previously received at your Gmail account, or select 'Enable POP only for mail that arrives from now on'.) Select the action you want applied to mail after you have downloaded it to your e-mail client under 'When messages are accessed with POP'. Finally, click 'Save Changes'.

Now that you're done with the Gmail settings, it's time to configure Eudora to send and receive mail through Gmail. Select **Tools > Personalities** from the menu in Eudora. Right-click in the 'personalities' window and select 'New...' from the context menu. Choose 'Skip directly to advanced account

'POP' is selected under 'Configuration:'. Make sure 'Required, Alternate Port' is the 'Secure Sockets when Receiving' choice. Click OK.

Add An Animation To Your Signature

 To add an animation to your signature, you first need to know how to create a new signature in Eudora. Here's how: select **Tools > Signatures** from the Eudora menu. Right-click anywhere inside the signature window. Select 'New...' from the context menu. Enter the name of the new signature. Click 'OK'. Type in your signature text, and select **File > Save**.

Now, to animate your signature, you'll need to use an animated GIF. First, create

to your animated gif" />, where you want to place the image. (Make sure "{path to your animated gif}" points to the animated gif and follows this format: "file:///C:/Documents and Settings/...".

Save the text file. Try the new signature. Don't be alarmed if the animation disappears shortly after showing up in the signature. It will display for the recipient.

Do Complex Searches

 Eudora provides a whole lot of search criteria for mail. If you explore the first drop-down menu in the 'Find Messages' dialog, you will see criteria from 'Age' to 'Priority' and from 'Attachment Name' to 'Personality'. For more complex searches, you can try and combine two or more criteria by clicking on the 'More' button, and selecting either 'Match All' or 'Match Any'.

Using this, you can construct searches combining up to five criteria.

Clear The Ads Cache

 Sometimes, Eudora for Windows in sponsored mode may complain that it isn't getting ads. To correct this, you can try clearing Eudora's ad cache.

Eudora keeps the ads in a directory called 'Ads' in the 'Eudora' folder. First, close Eudora. Then go to your 'Eudora' folder. Open the 'EudPriv' folder there, and then the 'Ads' folder. Delete all files in the 'Ads' folder. Finally, restart Eudora—the problem should have vanished.

Customise Eudora Message Labels

 Eudora has a great feature called Message Labels that lets you quickly assign a colour and a label to messages. By default, these labels are called 'Label 1' through to 'Label 7'.

You'll probably associate more with something like "to do" than with "Label 1", and you can change the Eudora labels to suit your

needs. To customise the message labels in Eudora, select **Tools > Options...** from the menu. Go to the 'Labels' category. Type in the desired name of the label in the entry field. Then click on the coloured box to open a colour selection dialog where you can assign any colour to your label.

Empty Trash Upon Exit

 To have Eudora empty the trash when you exit the application, go to **Tools > Options**, then to the 'Miscellaneous' category. Make sure 'Empty Trash when exiting' is checked, and click 'OK'. Keep in mind that all messages in the trash will be deleted and purged—and therefore, permanently lost—whenever you exit Eudora!

Identify Your Eudora Folder

 You probably will need to know, at some point or other, where Eudora stores your mails. Here's how to find the folder: on Windows 2000 and XP, go to **Start > Run**. Type in "%appdata%\Qualcomm\Eudora" (without the quotes). Hit [Enter] and you'll be taken to your Eudora folder.

If that doesn't work, search for 'eudora.ini' on your computer. If you get only one result, the folder containing 'eudora.ini' is your Eudora folder. If there are multiple folders containing 'eudora.ini', you'll have to open them all to identify 'your' Eudora folder. Look for .mbx files and .fol folders that match your setup of mailboxes in Eudora.

Insert Recipients Quickly

 If you have added the people (or lists) you send e-mails to most often to the Recipient List in Eudora, you can use one of the fastest ways to address a message. Using the mouse, you can add recipients to mails, forwards and replies easily and quickly from the Eudora Recipient List. To insert recipients quickly and comfortably using the mouse

setup', then click 'Finish'. Type in "Gmail" under 'Personality Name:'. Type your name under 'Real Name:'. Type your Gmail address under 'E-mail Address:'. Type your full Gmail address again under 'User Name:'. Type "smtp.gmail.com" under 'SMTP Server:'. Make sure 'Required, Alternate Port' is selected under 'Secure Sockets when Sending'.

Go to the Incoming Mail tab. Type "pop.gmail.com" under 'Server:'. Make sure

a new signature. Type your signature text. Make sure you use some HTML formatting in it somewhere so Eudora adds the necessary HTML code. It's enough to boldface a few characters. (You can remove the formatting later.) Hit [Ctrl] + [S]. Find and open your Eudora folder in Windows Explorer. Go to the Sigs directory. Double-click the (signature_name).txt file, where 'signature_name' is whatever name you gave your signature. Edit the file to include <img src="{path
