

in Eudora, start with a new message, forward, or reply. Click in the To:, Cc: or Bcc: field to put the cursor in it. Click with the right mouse button. Select **Insert Recipient > [recipient]** from the context menu that comes up.

Make A Filter From A Message

 Filters that automatically sort incoming mail are very useful, and they're best set up from existing messages in Eudora. To create an incoming mail filter from an existing message in Eudora, first highlight the message in the mailbox. Select **Special > Make Filter** from the menu. Enter details as you see fit. You can filter on the sender (it's best to look for the e-mail address only), any recipient or (part of) the subject.

By default, Eudora suggests you create a new mailbox named after the sender that the filter will move all mail to in the future, but you can also have it transfer messages to any existing mailbox (to select it, click the 'In' button), or delete them automatically. Finally, click 'Create Filter'.

Thunderbird

Adding A Background Image

 A white background all the time for your e-mails may become boring. To add a background image to a message in Thunderbird, first create a new message. Select **Options > Format > Auto-Detect** from the message's menu. Click in the message body. Select **Format > Page Colors and Background...** from the menu. Click 'Choose File...' under 'Background Image:'. Select the desired file and click Open. Click OK.

Add OpenPGP E-mail Security

 Plaintext e-mails are like postcards. Everybody can read what you send and receive.

Cryptography is the solution, and ensures that only the intended recipient can decipher your message. Thunderbird comes with great inbuilt support for S/MIME. But OpenPGP is the rivalling standard, and you can add support for it easily.

There's something called Enigmail out there, which works with Mozilla Thunderbird, Netscape and Mozilla, and supports both PGP and GnuPG as its encryption backend—

providing comfortable message security. Enigmail is easy to use, and works transparently and with per-account settings. It doesn't interfere with, but complements Mozilla's S/MIME support.

The latest version is 0.92.0, which works with Thunderbird 1.0.x. Visit <http://enigmail.mozdev.org/download.html> to download and install it.

Compose Mail From The Address Book

 To compose a message from the Address Book in Thunderbird, select **Window > Address Book** from the menu. Highlight the entry you want to compose a message to, and simply press [Ctrl] + [M].

Create A Filter From An Existing Message

 Filters that move all mail from a certain sender to a special folder are extremely useful—to have the really important and the not-so-important e-mails sorted out right away and automatically—and in Thunderbird, they are extremely easy to create, too. To create a filter from an existing message, open the message either in the preview pane or in its own window. Click on the sender's name or e-mail address. (In either case

Name, Description and Nickname. Start adding addresses by typing them in the list one at a time. Close the dialog and click OK.

Export Contacts From The Thunderbird Address Book

 Thunderbird makes it easy to export your address book to a format that most, if not all, other e-mail programs can understand. To export contacts from the Thunderbird Address Book, select **Window > Address Book**. Highlight the desired address book in the Address Books list. (If you are not sure which to select, choose Personal Address Book.) Select **Tools > Export...** from the menu. Make sure 'Comma Separated (*.csv)' is set under 'Format:'. Choose a location and filename, and click 'Save'.

Train The Spam Filter

 Thunderbird, as well as Netscape and Mozilla, have great spam filters. The Bayesian spam filter in Thunderbird identifies spam by calculating for each incoming message how likely it is junk. These calculations are based on how you have classified previous messages.

This means Thunderbird can make a very good guess on what your spam and your good mail looks like. It also means that you have to train the spam filter a bit so it can get an idea what you perceive to be spam.

To train the spam filter in Thunderbird, open a message you want to classify as junk and click the 'Junk' toolbar button. Alternatively, click in the 'Junk Status' column in the message list. Either action will toggle the junk status of the message. You can use it to mark junk not yet recognized by Thunderbird, but you can (and should!) also use it to reclassify mail that has been wrongly labelled spam.

Once you find the spam filter classifies mail satisfactorily, you can have it move spam to a special folder automatically. ☑

the thing to click is the highlighted text following 'From:'. Select 'Create Filter from Message...' from the menu. Select your desired action under 'Perform this action:'. Click OK.

As an alternative to using the sender's context menu, you can select **Message > Create Filter from Message...** in the Thunderbird menu.

Create A Mailing List

 Using Cc: or Bcc: is usually OK, but using a mailing list is easier and more elegant. Thunderbird includes support for simple mailing lists. To set up a mailing list in Thunderbird, select **Window > Address Book**. Click on 'New List'. Specify which address book the list should be added to. Give the mailing list a
