

Dipayan Kar
Manager-Sales,
Zicom Security Services

Zicom provides various corporations with security solutions. With regard to access control systems, the most common ones in use are proximity and smart cards. A great deal of information regarding the bearer can be carried on a smart card. They can also be programmed and customised depending on the client's need.

We have set up and are maintaining the entire access and smart system at iFlex. Here, apart from the usual attendance records, the card also carries canteen credits of an employee. This allows an employee to simply hold his card against a reader and the requisite amount is deducted. The card, of course, is topped up with the employee's canteen allowance at the beginning of every month.

The normal employee attendance and access permissions are also programmed into the card's chip and because of the centralised nature of administration, records of an employee are constantly updated in real time.

CONTROL

G Gopinath
Director of Rooms,
Grand Hyatt (Mumbai)

The Grand Hyatt has been using smart cards since March 2004. Although our staff doesn't use these cards for their daily access and attendance, we use them in guest rooms and residences.

The card is used as a room key that allows touchless opening of the door. By using this technology, hotel management can trace up to 150 opening and closing actions of a particular door. Due to the details entered of the opening and closing action, valuable statistical data can be gained. Lock installation schedules can be created and administrated flexibly with very little effort. The connection to other data pools via suitable interfaces enables a more cost-effective total management of the hotel due to faster sharing of information between departments.

The system also provides for a very high level of security. Also, every key is easy to replace and we can disable a lost key easily. This is the latest in room security and service and is in use at all the top hotels worldwide. Entire system is monitored by the Security department and administered by Front Office department.

Captain Sailesh
Head Security Systems,
Standard Chartered

Any security or access system set up for an organisation like ours needs to perform multiple functions. We have a number of critical locations on our premises. Each has various levels of restrictions. It is therefore imperative for us to have these restrictions embedded into the system.

All the staff members at StanChart carry an Access Control card. This takes care of the daily attendance muster and also generates reports on areas visited by an individual. The card readers situated at various critical and strategic locations in our office are connected to a central server where these reports can be generated.

These reports come in handy when it comes to ensuring that we have a secure set-up, which is a must for a bank, and also with respect to complying with the various Audits we conduct.
