

Google Earth is a program that you run on a computer with a broadband Internet connection. With it, you can visually zoom into any place on earth. When you download the free application from www.earth.google.com and run it, your computer accesses the server that has the information necessary to show you the image of the spot you're zooming into. The minimum bandwidth necessary for this is 128 kbps; 768 kbps or higher is recommended.

What is Google

Google Earth combines satellite imagery, maps and Google Search to put the world's geographic information at your fingertips. It's a mapping software using which you can explore the surface of the globe in realistic 3D.

As you're exploring, the software downloads and displays detailed satellite imagery from Google's servers, allowing you to zoom all the way to street level in some cities.

Contrary to popular perception, the images you see in Google Earth are not taken in real-time: they are photographs that have been taken by satellites and aircraft at some point of time over the past three years. These images are uploaded to Google's servers on a regular, rolling basis.
