Order, Order!

It's time to put the house in order—and for once, know where that elusive phone number or e-mail address is

Aditya Kuber

Information overload is a part of life today and it's important to know how to deal with it. The more the people we know online and offline, the tougher it becomes to maintain their contact and correspondence information. A Personal Information Manager (PIM) is a must-have in today's hyper-connected world: it's something that lets you store all contact and schedule information, and in some cases even correspondence records, in one place. Gone are the days of carrying bulky Filofaxes or multiple phone books—the e-age of information management is in.

The Outlook Way

Of all the PIMs available—whether free or paid—Outlook is the

best bet for all uses. If you have to work more out of office than on the field, Outlook is the most robust software of them all. It has enough scope to let you store as many contacts as you may know and then use them in the most effective manner possible.

Outlook lets you use your contacts for more than just reference. In fact, you can run the entire Outlook package from just the 'Contacts' section!

What are the essential pieces of information of a contact? Name, address, phone number, date of birth, work place, office contact details, anniversary date, duplicate contacts and then some notes. This, we would think, is the bare minimum. But how do you keep it up to date? More importantly, how does one use all this information? Sooner or later, there's enough that will make the labyrinth of data unnavigable.

Outlook takes care of all this and more thanks to the easy-to-navigate user interface that sorts all kinds of entries by name (or date). You
