As a business, it may be time to consider search engine optimisation for your site—if you haven't already. Here's how an online payment gateway, CCAvenue, benefited from it

Ram Mohan Rao

What would you do if you were an online payment gateway looking for more sign-ups? Advertising offline would be fumbling in the dark, because your potential clients are all online and Net-savvy. Advertising online in the form of banner ads is an option, but since your potential clients are actively looking for solutions on search engines, your best bet would be to hope that you show up when they search.

Actually, simply hoping will not do it. CCAvenue, an Indian online payment gateway, did not just sit hoping. They got their site professionally optimised, and the results are patent. When you type in "credit card processing india" (without the quotes) into google.com or google.co.in, CCAvenue comes up first. And even something like "set up a merchant account" brings CCAvenue up third on google.com and second on google.co.in, and "credit card payment setup" brings it up sixth on google.com and first on google.co.in (in all this, we're not talking about sponsored links).

CCAvenue doesn't rank so high for these keyword searches on the other search biggies—the ranks on MSN are just around the 10 mark. With Yahoo!, the ranks are somewhat lower.
