

A Nanotech Golf Ball

NDMX, a golf ball designed by NanoDynamics, is slated to be released in late 2005. NDMX can fly much straighter than normal golf balls, since its internal weight can shift dynamically. This allows the ball to follow its natural angle of flight, like the golfer intended.

In da Bginnin...

The Bible has been translated into SMS-speak in Australia so as to make its message more accessible. It begins, "In da Bginnin God cre8d da heavens & da earth." Only the spelling of the Bible has been changed for the project, not the language. All 31,173 verses can be downloaded for free.

AMERICA VS THE WORLD

Who Should Control The Net?

If you thought there would be no regulation issues with the Internet given its very nature, you are mistaken. Of late, a storm is brewing and if you didn't know, here's the situation as of now: the Internet is currently the responsibility of ICANN, under the US Department of Commerce.

ICANN has more or less been in charge of the DNS since 1997, when the US Department of Commerce handed over limited control, in the hope that ICANN would move towards internationalisation. While this isn't the entire picture, in general, it is the US that's in charge.

Delegates at a meeting in Geneva on October 10 tried—but failed—to reach an agreement on who should control the DNS.

As might be expected, the meeting turned into a squabble over whether America had the right to

control the DNS. Countries were split into those who were for US control and those that were against.

No prizes for guessing who was for the US: little brother Great Britain, of course, and some others such as Australia and Argentina. The Aussie delegates spoke of a "hierarchical and bureaucratic approach" if the UN stepped in.

And no prizes for guessing who was in the opposite camp, either: the EU, with China and Russia.

Iran figures in the list of those who spoke up: it said it was concerned the US could cut it off from the Net any time it chose. Oh!

So well, who should control the Net, then? A summit this month in Tunis, Africa, will see the argument rage on even further.

UNUSABLE!

The Acrobat Plug-in For MS Office Products

If you have both MS Word and Adobe Acrobat on your system, you may think that you can easily create a PDF file from a Word document. Far from it!

It never seems to work. Different versions of Word, and different versions of Acrobat, and different combinations of these, bring up different errors—and that nice PDF document remains as elusive as ever!

The worst part is, on some systems, Acrobat actually makes a toolbar of its own in Word, which refuses to go away. However, there could be a registry hack for this.

On some systems, you may get the error "The Macro cannot be found or has been disabled because of your Macro security settings," when you click the convenient PDF button.

And unfortunately, when you try going to the **Tools > Macro** menu, you get trapped inside another labyrinth of options, none of which help you accomplish what you want. Then you refer to the Word Help on "Adobe" or "Acrobat", and nothing comes up.

On other systems, something seems to happen, then Distiller sort of gives up and you end up with an error message of a different kind.

It remains to be seen after how many versions of Word (and/or Acrobat) will we get real interoperability.

Win! My Desktop

Think you have the most beautiful, most innovative desktop around? E-mail with subject **'My Desktop'** and your postal address to mydesktop@thinkdigit.com, and *Digit* will publish the most eye-catching of them each month.

This month's winner receives **Programming with Visual Basic 6.0**

The winner of this month is Sai Vardhan
