

Jagdish Mahapatra
Regional Manager,
Channels,
Cisco India and SAARC

Cisco's security approach stems from its self-defending network strategy. Essentially, we integrate security in every aspect of the network to create an end-to-end integrated system. This helps the network identify threats, react accordingly as per risk levels, isolate infected endpoints, and reconfigure the network resources in response to an attack or anomalous behaviour. This enables networks to deal with threats on their own, with minimal human intervention.

All enterprises look at lower total cost of ownership (TCO) for any product or solution. Security is no exception. Comprehensive security solutions are cost-effective and easy, as opposed to separate security devices that are resource-hungry, and difficult to manage.

Comprehensive security solutions integrate various functionalities like IDS, VPN, anti-virus and authentication into a single device, with provision for scalability and compatibility.

INTEGRATED

Companies are increasingly opting for integrated security solutions vis-à-vis varied point-to-point options. *Digit* tries to examine the reason for this trend...

Ajit Pillai
Country Manager,
WatchGuard
Technologies Inc

Our integrated security solutions comprise Firebox X Edge, a line of firewall and VPN endpoint security appliances. They deliver network protection to small businesses, remote offices and telecommuters. For instance, the Firebox SSL Core VPN Gateway is a product designed specifically for growing enterprises that allows authorised users to connect through an auto-updating, Web-deployed client, among other features.

Customers are fed up of piece-meal solutions and would like one vendor to take care of all the threats, and hence would prefer an integrated appliance. We also provide Live Security Service (LSS) to registered customers. This includes software maintenance, technical support, hardware warranty, LiveSecurity E-mail Alerts, Broadcasts, and related editorial content.

We mostly cater to the growing enterprise segment, which would have anywhere between 100 and 2,000 users. Earlier, different vendors offered different solutions. Now, customers get an integrated appliance and can hold one vendor responsible for the complete solution. We have been able to eliminate a lot of compatibility issues as well. Even globally, organisations are increasingly using integrated security solutions.
