

High-End**Sony CyberShot DSC-P200**

Specs: 7.2 Megapixel CCD sensor, Maximum Resolution 3072 x 2304, 3X Optical Zoom With Additional Digital Zoom, Manual/Auto Focus, 2.0-inch LCD Display, Integrated Flash, MS/MS Pro Memory Support, USB 2.0, Video-Out, Li-Ion battery

Our Verdict: The DSC-P200 is sleek and compact, and the Carl Zeiss lens provides amazing picture clarity. The ergonomics of the camera is perfectly designed for travel. The camera features an AF illumi-

nator—this emits light to facilitate focusing when the subject is in dark surroundings. 3X optical zoom may sound a little low, but the camera's high megapixel rating and excellent print and image quality make up for it. Low image noise and excellent low-light performance make the CyberShot DSC-P200 a winner.

Runner-Up: Nikon Coolpix 5900

**GRAPHICS CARDS****AGP cards - Budget****XFX GeForce FX 5200 256 MB**

Specs: nVidia GeForce FX 5200, 256 MB DDR Memory, 4 Pixel Pipelines, 250 MHz Core Speed, 400 MHz Memory Speed, DirectX 9 and OpenGL 1.4 Compliant, AGP 8X, Dual-Monitor Support and S-Video TV-Out

Our Verdict: Support for DirectX 9 means this card supports Pixel Shader 2.0 and Vertex Shader 2.0, so most games using these will be playable on this card, although at low resolutions.

Our tests showed that the card allows for moderate gaming at low resolutions. The XFX GeForce FX 5200 256 MB attempts to give you high-end features at rock-bottom prices, and in many ways, it succeeds in doing just that.

Runner-Up: XFX GeForce FX 5200 64 MB

**AGP Cards - Low-End****XFX GeForce 5700 Ultra 128 MB**

Specs: nVidia GeForce FX 5700, 128 MB DDR Memory, 4 Pixel Pipelines, 425 MHz Core Speed, 550 MHz Memory Speed, DirectX 9 and OpenGL 1.5 Compliant, AGP 8X, Dual-Monitor Support and S-Video TV-Out

Our Verdict: If 1024 x 768 is the gaming resolution you never breach, the XFX GeForce FX 5700 Ultra 128 MB is the card for you. This card can deal with most games with the eye-candy turned down. There is support for Shader Model 2.0+ as

well as OpenGL 1.5.

You can get big-screen gaming at a considerably low price via the S-Video TV-out. This card is for those who still have an AGP system and are getting warmed up for a bit of gaming with decent visual quality.

Runner-Up: Gigabyte GeForce FX 5700 128 MB

**Bose Wave Music System**

If you're looking for a music system that will fit on the corner table of your bedroom, your search ends here. The retro-looking Bose Wave Music System is packed with current-generation features, including an audio CD player, an MP3 player, an AM/FM radio tuner and an alarm that can wake you up to your favourite radio station. That's not all; the sound quality of the System will make a high-end 2.1 surround system sound ordinary.

These features are packed in a trapezoidal casing with a green display on the front panel that

shows the time and other information such as ID3 tags. All the functions to run this device are packed on the remote control, which explains why the thing is devoid of buttons on the front panel.

Other nifty features include automatic nighttime dimming of the display, gentle increments in volume to avoid sudden bursts in sound output, and the power cord that doubles up as an antenna.

And, of course, the sound output is pure Bose—pristine, clear and vibrant, with hardly a trace of distortion.
