

Keep Your Registry Clean With RegCleaner 4.3

You don't have to know what the registry is and what it does... just use RegCleaner4.3!

Anup Nair

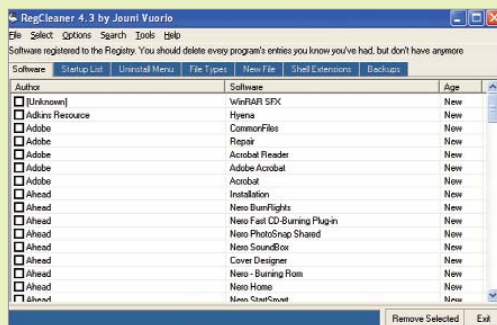

Many Windows users are not aware of the Windows Registry. Even if you've heard about it, you may not know what it does and why one needs to get rid of unwanted entries.

Windows maintains a log, in the form of the Registry, which records an entry for every software installed and being used. It even stores information such as each user's profile and hardware devices. This information is continuously referred to by Windows.

If you regularly install and uninstall applications, you'll have a lot of unwanted entries in your registry that will adversely affect the functioning of your PC. RegCleaner4.3 helps you with the task of cleaning the registry by scanning for irrelevant entries.

1 STEP Download and install RegCleaner4.3 is freeware. It can be downloaded from <http://www.worldstart.com/weekly-download/archives/reg-cleaner4.3.htm/>.

Double-clicking the executable file will start the installation process. You can deselect 'Language

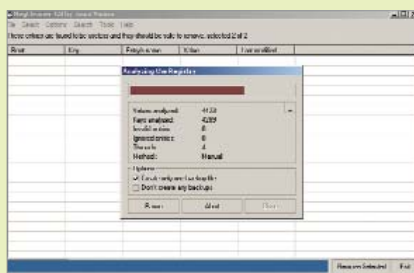

The RegCleaner4.3 with various tabs displaying the action to choose from

Packs' from the setup options. When the process says 'complete', there's still something left: you need to double-click the desktop 'RegCleaner' icon to finalise installation. Accept the disclaimer, and RegCleaner4.3 pops up.

2 STEP Cleaning The Registry The task of cleaning the Registry has never been this easy. Just go to Tools > 'Registry Cleanup'; this will display four options - 'OLE cleaner', 'Orphan file reference finder', 'Automatic Registry Cleaner' and 'Do them all'.

'OLE cleaner' cleans unused and invalid Object Linking and Embedded entries. (Object Linking and Embedding allows objects from one application to be embedded within another, for example, taking

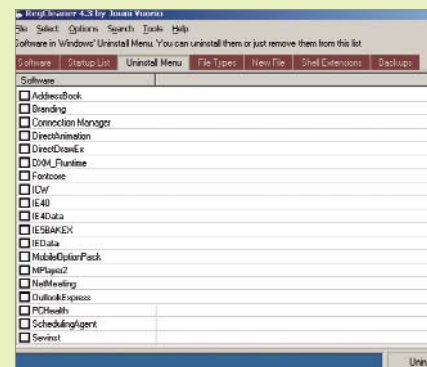

Choosing 'Do them all' option in 'Tools' registry cleanup will scan the registry for irrelevant entries

an Excel spreadsheet and putting it into a Word document.) Entries pointing to non-existing files are removed by the Orphan file reference finder. 'Automatic Registry Cleaner' scans the registry for old and invalid entries.

All the options display a list of invalid entries that you can select and remove. If you want to clean the entire Registry at one go, select 'Do them all'. This option scans the registry for irrelevant entries and lists them out. You can now select them all, and then click 'Remove Selected'. Make sure you've enabled 'Create only one backup file' before you remove entries without checking each one.

3 STEP Using The Uninstall Tab The main menu of RegCleaner shows up tabs - 'Software', 'Startup List', 'Uninstall

You can use Uninstall menu to display those applications that are not listed in Add Remove program

Menu', 'File Types', 'New File', 'Shell Extensions' and 'Backups'. 'Uninstall Menu' can be used effectively to remove unwanted applications not listed in 'Add and Remove Programs' in the Control Panel.

Clicking on the 'Uninstall Menu' tab will display a list of the software installed on your system. Drop down the 'Options' menu, go to 'Uninstall...', and select 'Show only hidden software'. This will display only hidden applications such as NetMeeting, Outlook Express and so on, programs that are not visible in 'Add and Remove Programs'. Just select the ones you don't need and click 'Uninstall'.

Be careful when you click 'Remove Selected', as this will not uninstall the software - it will just remove the entry. This option is useful only when a software is already uninstalled but the entry is still there in the 'Add and Remove Programs' list.

We've talked only about cleaning the Registry and getting rid of unwanted software. RegCleaner has additional utilities that can alter file types. It can also remove unwanted shell extensions. We do not, however, want to get into that, as deleting an extension without knowing in detail about what you're doing can crash your PC! ☹
