

Advanced Features In Word 2002

Most or all of us use Word, but not many of us bother with its advanced features. These features aren't "hidden" in any way—they're right there in the menus; it's just that we don't bother to experiment! Here are some features all of us can find use for at some time or the other.

AutoText

 AutoText offers a way to store and quickly insert text, graphics, fields, tables, bookmarks and other items that you use frequently. Word comes with a number of inbuilt AutoText entries divided into different categories. For example, if you're working on a letter, Word can offer letter-specific AutoText entries, such as salutations and closings.

You can also, of course, create your own AutoText entries. It's as easy as **Insert > AutoText > AutoText**. Here, you'll find the field where you can enter your own AutoText. This is useful if you often use the same large or complex item and don't want to have to reinsert or retype it, or if you want to store text that contains a particular style or format. For example, if you send customers a monthly report that always includes the same lengthy disclaimer, you can create an AutoText entry for the disclaimer.

When you create an AutoText entry, it's automatically linked to the paragraph style of the text or graphic you used to create the entry. This style is what Word uses to determine which submenu the new AutoText entry appears in on

Click **Insert > AutoText**. The little bar in red above can be dragged

The AutoText toolbar lists out AutoText in various styles

the AutoText submenu in the Insert menu. For example, if your report's disclaimer has the Normal style, Word links the AutoText entry to the Normal style. When you later want to insert the entry, you will find the entry on the Normal submenu (**Insert > AutoText**). In Word 2002, when you click **Insert > AutoText**, you'll see "Drag to make this menu float." Drag that item, and you will see the submenu.

AutoCorrect

 AutoCorrect automatically corrects text errors such as incorrect capitalisation and typos. You can also use AutoCorrect in

create an AutoCorrect entry that contains a field, symbol, paragraph mark, imported graphic, or an object other than text. Word preserves the entry's original formatting. Select the text or graphic you want to store as an AutoCorrect entry.

On the Tools menu, click 'AutoCorrect Options' and go to the AutoCorrect tab (make sure the 'Replace text as you type' checkbox is selected.)

In the 'Replace' box, type in what you want to replace—that is, the abbreviation or word that Word replaces automatically as you type. In the 'With' box, type in (or paste) what you want to replace that text with. If this contains formatting, the 'Plain Text' and 'Formatted Text' options will appear.

To save the entry without its original formatting, click 'Plain text', and to save the entry with its original formatting, click 'Formatted text'. Click 'Add'. When you're ready to automatically insert the AutoCorrect entry, type the entry name followed by a space or punctuation. You can store your own symbols as AutoCorrect entries. Go to **Insert > Symbol**. Click the symbol you want, and click 'AutoCorrect'. Store the AutoCorrect entry as usual.

Choosing Between AutoText And AutoCorrect

 AutoText and AutoCorrect use different methods to insert entries automatically. After setting up an AutoText entry and turning on AutoComplete, you can choose whether or not to insert the entry into your document. By

How often have you corrected typos by backspacing and then retyping? Avoid all the hassle with AutoCorrect

In AutoCorrect, you can choose between formatted and unformatted text. You'll want to choose the former in most cases

much the same way that you use AutoText, to store text or graphics you plan to reuse. If you create an AutoCorrect entry that contains text only, Word stores the entry without formatting. If you

contrast, when you use AutoCorrect to automatically correct text as you type, Word will always insert the text. If you decide you don't want the AutoCorrect entry, you must undo the insertion.
