

The Forms toolbar with its various elements

and change its font, size and colour so the answer field is easily differentiated from the question.

2. Add multiple spaces between questions to make them easier to read and complete.

Creating a Style

You can define a specific style and then use it to format text throughout your document. In this example, we'll create a 'bold and centred' style. To create this style, double-click a word. Click on 'Bold' in the toolbar. From the menu, select **Format > Paragraph**, or right-click and select 'Paragraph'. Select 'Centered' for the alignment and 1.5 lines for the spacing. Click OK. With your word still selected, from the menu, select **Format > Styles and Formatting**. 'Styles and Formatting' appears in the Task Pane. Click the 'New Style' button.

In the 'Name:' box, type in, say, 'Centred Heading'. Note the formatting characteristics. Click OK. Your new style, 'Centred Heading', will now be listed in the list of styles displayed in the

Word allows you to create your own styles, based on its predefined styles. Just select 'New Style' from the Styles and Formatting task pane

task pane.

To apply your new style to other text, highlight a line, for example, and in the Styles and Formatting Task Pane, double-click 'Centred Heading'.

Customise Your Toolbars

Right-click on the Standard toolbar (which, we assume, you've kept visible) and click 'Customize'. You'll see three tabs—'Toolbars', 'Commands', and 'Options'. Under 'Commands', you'll see—probably for the first time—all the commands Word is capable of! Each of these commands can be placed on a toolbar of your choice.

To navigate to a command, go to a Category (the list on the left). The commands under that category will be visible. You can simply click on a command and drag and drop it onto a toolbar of your choice. So, for example, if you want to add 'Next Misspelling' to the 'Extended Formatting' toolbar, first check 'Extended Formatting' in the Toolbars tab. Then, if

'Next Misspelling' is not already there on that toolbar, go to the Commands tab, navigate to 'Next Misspelling', and drag and drop it onto the 'Extended Formatting' toolbar.

Of course, you can drag and drop any command at all

onto any toolbar at all. You can create new toolbars and give them names, too!

Create Your Own Custom Word Templates

Why use the same kind of blank document every time you open Word? You might want to use a different font every time, and you probably reformat the

Under the 'Create New' section, click 'Template', and click 'OK'. Now comes the fun part: in the new template, add any text and graphics you want to appear in all new documents that you base on the template, and delete any items you don't want to appear. Also make the changes you want to the margin settings, page size

One of the most useful of Word's advanced features is the ability to create templates. Here we've created a template with a heading and a picture. To open a document using the new template, click **File > New**, which opens the New Document task pane. You'll need to use 'New from Template'. Also, you might want to keep 'Show at Startup' checked

document every time. Similarly, you might want a signature with every file, including, possibly, a picture. You can create a template of your favourite font styles and sizes and use it whenever you want—it's as easy as creating a new document. Then, each time you open a document, what you'll need to do is click **File > New**, and in the task pane that opens up, go to "New from Template"—and select your template.

To create a custom template, click **View > Task Pane**. If the 'New Document' task pane is not visible, select it from the drop-down menu in the upper right corner of the task pane. Now, in the New Document task pane, click 'General Templates'. In the 'Templates' dialog box that appears, select the 'General' tab, click the 'Blank Document' once to select it. This will be the base for your new template.

and orientation, styles, and other formats. Finally, click **File > Save**, and give your template a name.

Align Shapes Using Gridlines

Did you know that Word features a drawing grid you can use to align drawing objects, such as AutoShapes? By default, gridlines are not visible. To make them visible, on the View menu, point to Toolbars and click Drawing. On the Drawing toolbar, click **Draw > Grid**. Select the Display gridlines on screen checkbox. Choose the options you want and click OK.

You're now ready to add shapes to your document. To see all the shapes available, such as telephones, click 'AutoShapes' on the Drawing toolbar and then click 'More AutoShapes'. Then make your selections from the Insert Clip Art task pane. ☑
