

Bubble Jet Printing

The bubble jet printer makes use of a small ink-vapour bubble inside the ink chamber

How Inkjet

When the printer has something to print, it sends a signal to a heating element, which starts to get hotter. The vapour bubble expands from this heat, pushing the ink towards the nozzle

When the bubble gets big enough, the ink is finally pushed out of the nozzle onto the paper

When the heating element cools down, the bubble becomes smaller, allowing ink from the ink reservoir to enter the chamber
