

Piezoelectric Printing

The **piezoelectric printer** works using the property of some materials that makes them expand or contract if an electric current is passed through them

Printing Works

When there's something to be printed, the printer sends an electrical signal to the piezoelectric crystal, which starts expanding, pushing ink towards the nozzle

When the crystal has expanded to its fullest, it pushes the ink out of the nozzle onto the paper

When the electrical signal stops, the crystal returns to its normal size, and more ink can now come into the chamber
