

► How BitTorrent Works

You click on a .torrent link, which contains information about a server called a “tracker.” The tracker has information about who has what parts of your file—these people make up a “swarm.” In the swarm is at least one “seed”—someone with the entire file. Some people get parts of the file from one or more seeders, and the process begins.

You begin downloading simultaneously from several peoples' computers, at the same time uploading parts of what you've downloaded to others in the swarm. This happens because different people in the swarm have different portions of the file. You're now part of the swarm! Ultimately, everyone in the swarm will have the entire file.

The trackers cannot be prosecuted because they do not know the contents of the files they are tracking, and neither do they go about finding the seed—it's the seed that registers with the tracker!
