The S4 retains pretty much the same looks as the phone it succeeds, the Galaxy SIII. However, the thin bezel on the front means the S4 can pack in a larger display without the phone becoming any wider. In fact, the S4 is thinner and lighter than the SIII. However, the plastic chassis is retained, which has seen a lot of criticism shovelled Samsung's way.

It isn't a slouch in terms of performance. In the benchmark tests, the S4 took the lead over the HTC One, but in real world usage, it's too close to call. When you are in quad-core territory, performance gains from an octa-core aren't very visible in a typical usage scenario. It lasts a day

and a half on a single charge, as a primary phone.

Very neat features such as Smart Stay, Smart Video Pause and the Sound Shot mode along with apps such as S Health, S Voice Drive are present.

The S4 has a camera that does fairly well in good lighting conditions, but disappoints as soon as the light goes down. Also, while the display impresses in terms of crispness and colour richness, the quality of the whites is disappointing, perceptibly so when compared side by side with the HTC One.

All in all, the S4 is a very powerful phone, but with rather underwhelming build quality.

HP 2000 – 2202TU notebook

Older gen hardware, but with an excellent keyboard

For an affordable laptop, the 2202TU is quite well built, with good quality materials used and no perceptible flex at – underside and the middle of the keyboard.

That good work is spoiled to a certain extent by the glossy finish that adorns this laptop. If you aren't entirely pedantic about keeping it in pristine condition, the scratches, nicks and fingerprints will be visible.

Its older generation hardware cannot be held against the 2202TU, simply because it sells at an affordable price. Performance is acceptable, but with 2GB of RAM, you will have hit some a ceiling in terms of how many applications can be opened in parallel before the system load becomes clearly visible.

Upgrading RAM is simple

– the slot is easily accessible, but then again, anyone buying this machine on a budget accepts the limitations and isn't looking for blazing performance anyway. Battery life is a bit disappointing, and will last around 1.5 hours when

used in a typical usage scenario at work or in college. Sandy Bridge's battery consumption can be blamed for this. HD videos play back stutter free. The keyboard is very good, something that is rare on affordable laptops. Basic speakers, that just get the job done. You literally get what you pay for.
