Adblock Plus Beta for IE

The popular online ads blocking browser extension Adblock plus is now available to download and install on Internet Explorer, but in BETA version

CIDEKO ANDROID SMARTBOX KEYBOARD

Android smartboxes aren't new and we do get a lot of them these days. But what caught our eye at the booth of Cideko was the various portable keyboards on offer. The Android Smartbox houses a 1.5GHz dual-core processor, runs on Android 4.2, has 1GB of DDR3

RAM and comes with bluetooth, Wi-fi and the connectivity ports. The sad part is that the company does not sell single units for online buyers.

houses a rear and front facing 2MP camera. Under the hood, the tablet has a dual-core 1.8GHz Intel Atom Z2760 processor along with 2GB of RAM. It's out in the market, and you can take an up close and personal look at the Iconia W3 by visiting this link: <http://dgit.in/19gGFBS>

Acer Aspire R7

Although the Acer Aspire R7 was released just before Computex 2013, it still remained one of the biggest highlights of the show and definitely a crowd puller to Acer's booth on the floor. It's primarily an Ultrabook, the Aspire R7, but due to its innovative hinge design – Acer calls its Ezel hinge – its display can detach itself from the traditional clamshell form factor to “float” in numerous orientations. In fact, the screen can completely flip on its hinge and glide down on the keyboard to transform the device into a tablet. Another interesting design characteristic of the Aspire R7 is that it places the touchpad above (and not below) the keyboard deck – wonder how that's going to pan

out. But if there's one thing the Acer Aspire R7 does really well is to give you unhindered flexibility, letting you interact with the 13-inch touchscreen the way you want. Take a look: <http://dgit.in/15vdF1K>

Intel

The world's largest PC chip-maker had a lot to show-off at this year's Computex. On the eve of the show, as is the custom of big brands trying to make a big splash at the event, Intel officially released its much-awaited “Haswell” platform which represents its fourth-generation of Core i processors. With Haswell, Intel has improved on the micro-architecture while keeping the process node at 22nm. Please refer to our our deep-dive into Haswell in last month's anniversary issue cover story, F5 and don't forget to read the reviews of the Core i7-4770K and a couple of Z87 chipset sporting boards. The latest generation of Core processors were showed off on devices made by Intel's partners (OEMs, in other words) – along with ASUS and Acer mentioned earlier, companies like Dell, HP, Lenovo, Sony, Toshiba, and a few others had products of different shapes and sizes (all sporting Intel's new processors) on display on Intel's booths. We've captured some of them in a slideshow called “Intel's Windows 8

Convertibles” on our website: <http://dgit.in/124S8yS>

Apart from its attempt to reinvigorate the PC market, Intel took a big step towards challenging ARM in the tablet and smartphone arena, by announcing its 22nm Intel Atom-based SoCs for tablets and ultra mobile form factor devices, code-named “Bay Trail”. Based on the Silvermont microarchitecture, these new Intel chips support quad-core processing, DirectX 11, hardware-based security features, graphics improvement, and can handle both Android and Windows. Apart from the ASUS Fonepad and Memopad, the Lenovo K900 smartphone and Samsung Galaxy Tab 3 10-inch tablets showed-off the new Intel SoCs at their Computex 2013 booth.

One catch-phrase that was spoken of a lot was ‘2-in-1’. The devices which will be sporting the Haswell chips belong to a variety of form factors such as Ultrabooks, convertibles, sliders, hybrid notebooks and so on. The ‘2-in-1’ nomenclature is Intel's

Intel Haswell is here

GIGABYTE BRIX DEMO

Gigabyte will soon come out with its own mini PC – the Gigabyte BRIX. Based on the Intel's Next Unit of Computing (NUC) reference design, the BRIX is aimed at users looking at a small form factor PC for basic use-case scenarios. Apart from basic home usage, Gigabyte is also targeting this devices for use in digital signages and other business related uses. The unit we got to see was a barebones model, which does not come with any storage or RAM memory. You can add in your own mSATA based memory. The device comes with two USB 3.0 ports, an HDMI port, a mini-DisplayPort, LAN port and so on. Gigabyte BRIX will come with the 1007U Intel Celeron, Core i3-3227U, Core i5-3337U, and Core i7-3537U configurations which will be priced accordingly. The Indian prices are not yet out.

way of grouping these form factors under one umbrella. So any device that can be used both as a tablet and a regular notebook will fall under this category. “The 2-in-1 is the new norm,” said Intel EVP Tom Kilroy at the Intel Keynote. “It is a laptop when you need it. It is a tablet when you want it.” According to Intel there are more than 50 different 2-in-1 designs based either on the Haswell chips or Silvermont processors.

AMD

AMD has been lagging behind Intel when it comes to computing prowess, but when we talk integrated graphics, the tables are turned. AMD showcased its roadmap which included the next generation of
