

Java updates security

A newly released Java 7 Update has fixed 40 issues which affected client deployment, server deployment, Java installer and Javadoc.

World's fastest

China's Tianhe-2 is the world's fastest supercomputer producing 33.86 petaflops per second in Linkpack

update out there soon. BlackBerry's Product Manager, Michael Clewley has revealed a few of the features that users can expect in BlackBerry 10.2, which should be released in the second half of this year.

Clewley made this announcement via his BlackBerry Messenger channel, revealing four features. First off, OS 10.2 will finally bring

BlackBerry is certainly working hard at tweaking their OS

support for standard unicode emojis. Expected, considering BBM is supposed to go multi-platform very soon. Second is the "Setting a time to remember item" feature. Next up is the, option for multiple alarms. Also, OS 10.2 will bring support for Level 1 Notifications.

The update will also bring to the platform the ability to side-load Android 4.2 Jelly Bean apps on the BlackBerry. The company took to their blog to explain the update, stating that 'Adobe AIR 3.5 brings with it Stage3D for accelerated OpenGL graphics and the Android run-time upgrade brings it up to Android 4.2 (Jelly Bean) compatibility.'

Google's Android Nation

India will soon become only the second country in Asia, after Indonesia, to get a Google branded retail store that will sell Android devices from multiple manufacturers. Android Nation, the retail store, backed

by Google in partnership with Spice Telecom, will get its first outlet in Select Citywalk malls in New Delhi, later this year.

According to the Economic Times, the Android Nation store will also let users get their hands on the latest Android devices and also learn about the features of the operating system. Apart from that, the store will also have resident experts who will provide support to Android users and inform them of the latest Android updates. Spice chairman, BK Modi also told the Economic Times that it hoped to extend its partnership with Google to the Middle East and

other countries like Malaysia, Thailand and Africa.

Moto X Android

Motorola Mobility head Dennis Woodside has confirmed that that the long rumoured 'X Phone' will be launched as the Moto X this year. While speaking at the D11 conference being held in California, Woodside said that the Moto X will be launched, at least in the US, by October and unlike the Nexus phones from Google, it will be a widespread launch, which means that there's a great chance

Aww such a cute little android

Woodside talking shop

it will be hitting other countries as well, including India.

Woodside further said that the Moto X will be the first phone from Motorola manufactured entirely in the US. While this detail in no way lessens the chance of a global launch, it could very likely mean that the Moto X could be priced on the higher side because of higher production costs in the US. Woodside refused to share more details or even show the Moto X unit that he had in his pocket. He, however, professed his confidence in the phone claiming that it would be constantly aware of what was around the user and what the user was doing. Woodside claimed that the phone could be programmed to immediately turn on the camera once it was taken out of the user's pocket but it wouldn't do so if it recognized that the user was driving. Woodside also tried to allay fears of poor battery life because of those features by stating that the Moto X had two processors that would shift the workload in order to preserve the battery.

Woodside also said that the Moto X wouldn't be the only phone from Motorola's stable and the company had other phones also in the pipeline. Although he didn't talk about these devices, we'd assume that they include the three phones whose details were leaked back in March- the Ghost, the Yeti and the Sasquatch. According to those rumours, the Ghost (XT912A) sports a 4-inch 720p display, a quad-core 1.7GHz

Snapdragon S4 Pro processor, an Adreno 320 GPU and Android 4.2.1. The other two phones are also expected to run on Android 4.2.1.

Nokia's July 11 Event

We were just starting to wind-down from the excitement of E3 and WWDC, and Nokia's already thrown a curve ball our way. Invites for an event scheduled for July 11 have been sent out with the tagline "Zoom Reinvented." We're putting out money on the fact that that's when the company will introduce the heavily-leaked Nokia Lumia EOS, the 41 megapixel Windows Phone 8 device.

The invite that went out specifically emphasizes on the ability of zoom. We're led to believe that this will be thanks to the innovative thinking up in

Will the Lumia EOS be out by the time you're reading this?

Nokia's Imaging R&D department coupled up with the insane pixel count on the Lumia EOS.

We've seen the Nokia PureView 808, which also had a 41 megapixel sensor and performed incredibly well as an imaging device. Even if Nokia packs in the EXACT same sensor into the Lumia EOS, they would still have a winner on their hands as no camera phone in the market comes close to the imaging quality from the half-inch slab of Nokia Silicon, coupled with a modern OS such as Windows Phone 8.
