App Watch

Greater than the Parts

There are no smarts for smartphones without apps, which provide on-the-go entertainment, convenience and utility, turning a phone into a Swiss army knife of the digital age.

iTunes Radio Service

Apple officially announced the music streaming service that everyone expected at WWDC. No, it isn't called iRadio (something that we had pointed out here, but iTunes Radio. The service will offer free internet radio, with over 200 stations streaming. Additionally, the service will link-up with the iTunes music store catalogue.

"iTunes Radio is an incredible way to listen to personalised radio stations which have been created just for you," said Eddy Cue, Apple's senior vice president of Internet Software and Services. "It's the music you love most and the music you're going to love, and you can easily buy it from the iTunes Store with just one click."

The iTunes Radio service will be available on the iPhone, iPad, iPod Touch and the MacBook, and also on the PC via iTunes desktop software. The service will be launched this fall, in line with the iOS 7 release, and will focus on making the experience as personalized as possible. The idea is to understand what a particular user listens to, and personalize the radio stations based on that. This will be synced across all devices you may have signed in on.

Apple says that iTunes Radio users will be treated to exclusives from time to time, like a yet to be released single, or an entire album available for listening before its official release.

iTunes radio looks pretty nice

iTunes Radio will be ad-supported, and free to use. iTunes Match users however get the additional goodness, because the subscription makes iTunes Radio ad-free. An iTunes Match subscription costs Rs. 1,200 per year.

Office Mobile for iPhone now available for Office 365 subscribers

Microsoft has released Office Mobile for iPhone for Office 365 Home Premium and Office 365 ProPlus subscribers. The new app is similar to Microsoft's Office Mobile for Windows Phone platform and enables improved Office content viewing and on-the-go editing capabilities on the iOS. The Office Mobile for iPhone is available at no extra charge on the Apple's App store. To start, you need to sign in to an Office 365

account. Afterwards, you can access, view and edit MS Word, Excel and PowerPoint documents. Microsoft says Office Mobile ensures content and formatting intact, keeping the look consistent across devices.

"When we launched Office 365 earlier this year, we committed to delivering regular updates and new capabilities to Office 365 subscribers. Since then, we've expanded Skype calling and added new OneNote features. Office Mobile is another great example of the value of subscribing to Office 365, and I can guarantee you, there will be lots more to come," says Microsoft's Julia White, General Manager, Microsoft Office Division in a blog post.

Microsoft further says Office Mobile ensures quick and easy access to Office content, even in the cloud on SkyDrive or SkyDrive Pro. So, when you're

using your iPhone, it'll be easier to access the content you viewed on your PC in the Recent Documents panel. Also, you can view and edit Office documents sent in e-mail.

Office Mobile has also been optimised for smaller screens. Functions such as Slide Navigator enables you to page through PowerPoint presentations faster and Speaker Notes enables practice presentations on the go.

"When reviewing Word documents on your phone, the Resume Reading feature takes you to the exact point in the document where you left off on your computer so you never miss a beat."

Moreover, Office Mobile comes with built-in sharing

Office 365 users might have reason to rejoice
