Security watch

Straitjacket symphony

Nothing's certain but death, taxes, and futility in security. In the ever more hostile-environment inhabited by globally connected devices, staying one step (if not two) ahead of your attackers is the new definition of cyber-security.

New Indian cyber security framework

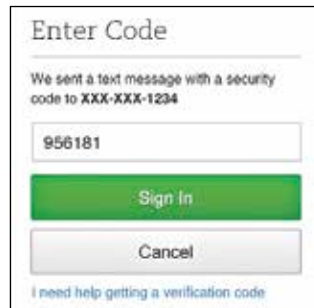

With cybersecurity becoming a major concern globally, the Indian government is implementing a new architecture to keep its IT infrastructure secure. According to a Times of India report, the new architecture envisages an inter-linked set of bodies in departments such as NTRO, defence and home ministries. CERT will be the umbrella body that will take care of the cyber security. The inter-agency structure will be headed by a cybersecurity coordinator, whose name will be revealed very soon.

The framework, cleared by the Union Cabinet last month, also envisages working closely with Internet Service Providers (ISPs) to monitor the metadata of Indian users. However, this would be different from US' PRISM as it will not be covert.

The architecture is rooted in the IT, Act 2000, particularly Sections 43, 43A, 72A and 79, which make it mandatory for the companies to adhere to data security and privacy protection guidelines. It also envisages multi-layered protection with responsibility distributed among various government bodies.

Indonesian 'Cyber Army'

The Indonesian Ministry of Defense is planning to create a special 'Cyber Army' to ward off threats from hackers on the state's Internet portals and web-

Evernote's authentication process can be better

sites that could jeopardize the security of the state.

The plan has come into inception as a result of roughly 36.6 million cyberattacks on the government Internet portals and websites during the last three years, as reported by Xinhua. According to Pos, the 'Cyber Army' will be guarded by uniformed soldiers with special training in Information Technology. Indonesian Defence Minister, Purnomo Yusgiantoro, said that the establishment of the task force would need dedicated support of the Communication and Information Ministry.

The ministry will provide telecommunication infrastructure,

equipments and skilled trainers for the members of the proposed 'cyber army', Purnomo added. He also announced that the ministry is also in the course of setting up a system to be known as "National Cyber Security" to secure websites of government bodies and agencies.

Twitter, Evernote roll out two-step authentication system

After having suffered a series of hacking attacks a few months ago, Twitter has finally announced rolling out a two-step authentication system to help its users keep their accounts more secure.

"Everyday, a growing number of people log in to Twitter. Usually these login attempts come from genuine account owners, but we occasionally hear from people whose accounts have been compromised by email phishing schemes or a breach of password data elsewhere on the web," says Twitter in a blog post.

Evernote is also adopting more stringent security, after an unauthorized infringement

compelled Evernote to reset over 50 million user passwords on March 2. Three new measures include a two factor authentication, along with 'access history' and 'authorized applications' measures, initially to go live to its premium users.

Microsoft saves 2 million PCs from Citadel botnet

Microsoft has recently stated that it saved millions of computers from being victimized by one of the world's biggest cybercrime rings. The company confirmed that a virus had infected 2 million PCs, and used to steal \$500 million from bank accounts across the world. The

Citadel Botnets targeted firms varying from tiny credit unions to big global banks such as BOA, HSBC, Credit Suisse and the Royal Bank of Canada.

"We definitely have liberated at least 2 million PCs globally. That is a conservative estimate," Richard Domingues Boscovich, assistant general counsel with Microsoft's Digital Crimes Unit, said in an interview on Tuesday.

"We feel confident that we really got most of the ones that we were after," he said. "It was a very, very successful disruptive action." He also said that the vast majority of the machines were infected in the United States, Hong Kong and Europe. 

Didn't imagine Twitter's login verification window to be in pink
