

HOW GAMES ARE MADE

We all like to play them, but do we ever

spare a thought on how exactly are video games made? Polygon tries to illustrate the process by shadowing a team working on their next project. It isn't as easy as it looks.

INNOVATOR VS. THE GOVT MACHINE

The pace of technology's evolution is fuelling several innovators' drive to

participate in fundamentally new markets and economies. However, this tide is being stemmed by draconian government policies and the judicial system. Some examples:

Apple Worldwide Developers Conference, 2013

- Compiled by Umang Moda

The quarter that went by heralds the beginning of a time that is of paramount relevance to the life of a technology enthusiast. Some of the biggest corporations in the business hold their press conferences and keynotes which give us a profound insight into the future of the digital realm. The existence of confidential projects in the industry is impossible to be denied and the so called hype train gathers the most momentum at this time of year. Even the gaming industry is no stranger to this season of announcements – major players in the industry, including Microsoft and Sony, unveil all that is in store for their respective entertainment divisions at the Electronic Entertainment Expo.

However, for Apple fanboys the proverbial mecca is Apple's WWDC. The World-Wide Developers Conference has played host to some of the most pivotal keynotes ever delivered. In 2010, Steve Jobs announced the iPhone 4. The following year, the Mac OS X Lion along with iOS5 would be revealed. WWDC 2012 had the MacBook Pro with its Retina Display being shown off and a complete showcasing of its updated mobile operating system, iOS6. Such announcements fortify the cult-esque status that Apple enjoys today.

It is rather conspicuous to note that the anticipation leading to WWDC 2013 was on a record high. So high that the tickets for the event were sold out in an astounding 71 seconds of being put on sale. With such high hopes, the ball was in Apple's court to enthrall the audience overflowing with mad levels of curiosity surrounding the keynote. And boy did they make a slew of announcements!

**The keynote**

So what did the minute and 11 seconds of buying frenzy get the Apple fan? A phenomenal keynote by Tim Cook. Pretty frustrating for the copious fans here in our country who would have killed to be a part of it. Fortunately enough, we've bundled the keynote for you on our DVD, so you can catch up on all the highlights of the event. If you happen to not be amongst the most rabid of all fanboys, Apple's official WWDC 2013 website does a good job at presenting a succinct overview of the entire event, the link for which is <http://dgit.in/11ABIUO>.

The Announcements

Evidently, revelations were to be made. And they were. In the ensuing keynote, Tim Cook of Apple presented a new model of the Mac Pro along with the updated MacBook Air. iOS7 was also demonstrated, as was Apple's new operating system titled, OS X Mavericks. iTunes Radio, a new music streaming service was also introduced. These were the major highlights of the press conference. For those looking for an in depth list that carries every single announcement made, The Verge has a definitive article covering just about everything here: <http://dgit.in/11YDxlm>.

The Live-Blogging

A peculiar aspect that surrounds the coming of any press conference or keynote is the existence of live blogs. These blogs contain every little bit of information right from the on-stage ambiance to the covering of major announcements. What separates live blogs from other sources is clearly the apparent presence of the raw emotions that makes them unique in their own way and particularly enjoyable to read. While there are numerous live-blogs that covered WWDC 2013, Engadget's live blog has vivid coverage that starts off 40 minutes prior to the beginning of the keynote, and is one of the best available. The live blog also contains several pictures of memorable moments from the conference and can be found in a compilation over here: <http://dgit.in/18aFpz5>

The Unannounced

Geeks are a greedy bunch and it is nigh impossible for us to be ever be satisfied with the announcements that a keynote could bring. Reports spurred up rumours of a ton of features to be announced by Apple, which it unfortunately did not. These included minor updates to Apple Maps which has been marred by controversy since its announcement back at WWDC 2012. Rumours of a wearable Apple device were put to rest, saddening a whole bunch of fans. Seemingly, the once-glorious iPod has been left in the dark as it barely even got a mention, along with Apple TV. However, it is hard to please everyone (and not everyone knows that iPod announcements have only been made previously at media events). Mashable's analysis of the keynote here, <http://dgit.in/11AKY5W>, is a rather interesting read and provides the perfect closure.
