Apple releases iOS 7 at WWDC

This year at WWDC, Apple announced the release of the latest iteration of iOS. The newest release – iOS 7 – has been designed with a whole new interface in mind and has been seen as the biggest change since it was first released. This not only means that there are a lot of changes and features for the consumer,

it also means that there are a lot of goodies for the developers too. Of course, following this announcement, the iOS developers will have to redesign their application while keeping the newest changes in mind.

The most appealing aspect of iOS 7 is definitely touted to be the flat and simplistic design

that the general UI elements are presented in. Some other noticeable features include a “Control Center” which could resemble the notification bar in Android, where you can toggle quick settings. There is an enhanced notification center, which shows you everything related to weather, calendar and app notifications. Multi-tasking is something else that has been given a huge uplift and has been made much smarter and better. Among others are features like a new radio service, AirDrop sharing. The App Store has also seen a few updates including features which shows nearby apps and automatic updation of all apps.

Since the guidelines for developers have already been released, it is understood that app developers are expected to start working on re-designing their apps for integration with the newest features. >

Java EE 7 at a glance

>>Around 3.5 years have passed since the last major version jump of the Java Enterprise Edition (Java EE). It was intended to be more powerful in Java EE 7 via cloud support. These plans proved too ambitious at quite a late stage. As a result, the version that was completed in mid-April contains very few fundamentally new aspects and just represents a consistent effort to round off existing features. Read:
