

No disturbance by unwanted mails

a major update recently, called Gmail 4.5. It introduces a new interface, features and mail categories for a better mobile Gmail experience. As settings are reflected from the web version of Gmail, you'll not see a tabbed interface unless the new inbox is enabled on your desktop. The redesigned app features contact pictures on the left-hand side of mail from these contacts, a swipe-to-refresh option and an action bar located at the top. The checkbox from old Gmail is replaced with contact images; so to multi-select mail just tap the contact images.

Turn off contact images for Android

As we mentioned, contact images now appear on the left-hand side of email in your inbox. However, if you want a minimal look, you can turn off contact images. To do this, tap the Menu icon on the action bar located at the top > Navigate to 'Settings' > General Settings > Uncheck 'Sender image'.

Multi-select mail without contact image

On Android, tapping on contact images allows you to multi-select email, but if you've turned off the option to display the images, it cannot be done. In such case, long-press on an email to select it; this will bring up the option to delete, mark as read or move the message to other labels. Pick

the last option. Then select other mail by again long-pressing on each one and choose the same option for them.

Get notification for every email on Android

The revamped Gmail app version only notifies you about mail that appears under the Primary tab. All other emails which appear in Social, Promotions, Updates and Forums remain unnotified. This is a neat feature as the emails from these tabs are less important. To get a notification for every email, you'll have to turn it on manually. Navigate to Menu > Label Settings > Check 'Label notifications'.

Refresh mail on Android

The refresh button in the action bar has been removed. So if you're wondering how to refresh, just swipe down (do a pull-down motion) on your

inbox. This action will also sync your mail.

OPERA

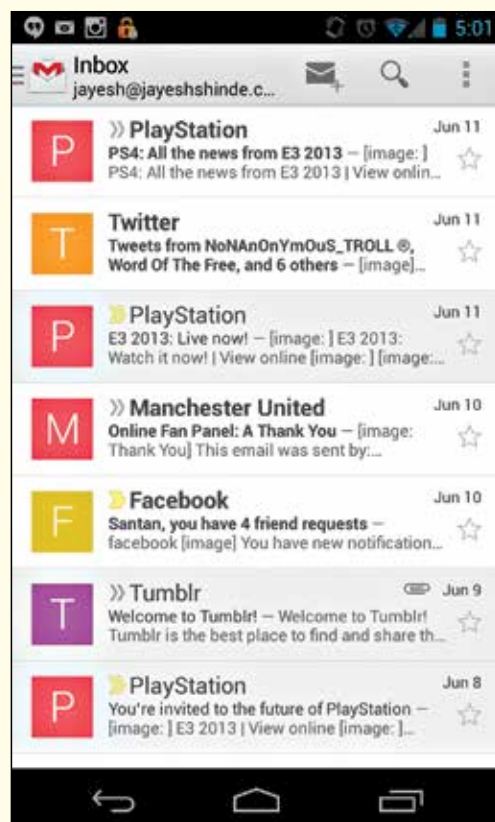

The second oldest browser that is currently in use, Opera is a top internet browser that is secure, fast and jam-packed with features. Opera has always been known for being the first to introduce new revolutionary features, such as tabbed browsing, mouse gestures, and speed dial. Even though the mobile counterpart of the browser, 'Opera mini', is doing much better relatively, the computer version of this browser is not far behind. It gives stiff competition to the other popular browsers in terms of speed and security. What sets Opera ahead of its competition is that it boasts of arguably the most customizable interface amongst all the browsers. Add to this, a wide range of features that make your browsing experience truly your own, Opera is defi-

nately a browser worth a shot. Here are some tips & tricks for the latest Opera 12.15, which will make your browsing experience much more fulfilling.

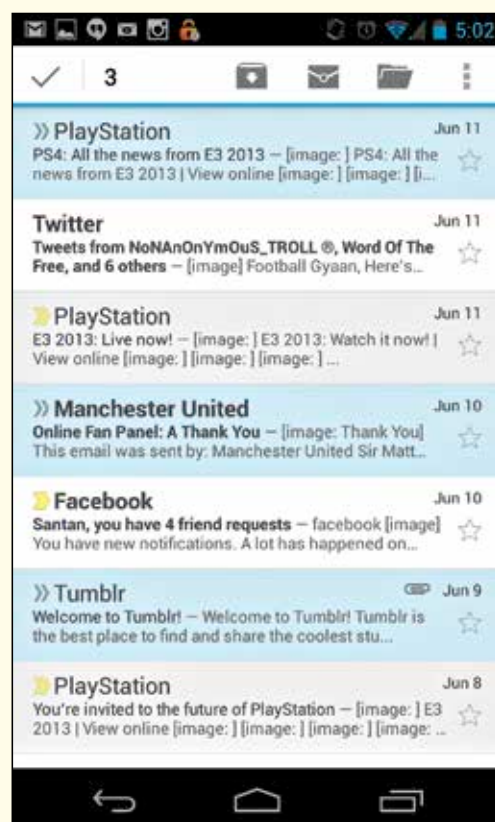

Shortcut Keys: Opera gives you a wide range of shortcut keys enabling your browsing experience to be quick and convenient. Let's have a look at a few of them.

Scroll is Pan

Move a document in the window by dragging (like in Adobe Reader) which makes it much more convenient to read articles, especially for touch-screen laptops/interfaces. You can enable this permanently by going to `opera:config > User Preferences > Scroll is pan` (check the box). But this might be impractical at times, because doing so will not let you choose text by clicking and dragging. Opera gives you a shortcut for this also. Just press `[CTRL]+[ALT]+left-click` and drag the page to your heart's content.

Your inbox gets colorful with contact images

It's also easy to multiselect without contact images
