Google's Dart SDK arrives

Google released the first beta SDK for its JavaScript alternative engine Dart. It includes an update for improving performance and productivity on the platform. <http://www.dartlang.org/>

System heating up, reviving damaged socket pins, WP8 issues and more...

We scour sos@thinkdigit.com for troubleshooting issues bothering you

Q Blue screen while gaming

My notebook configuration are as follows:

- Model name: Compaq Presario CQ43
- Processor: Intel Pentium CPU B950 @2.10GHz
- System Memory: 2GB
- Graphics: Intel HD Graphics
- OS: Windows 7 Ultimate

Whenever I play games such as Hitman Blood Money, Duke Nukem Forever, Alice Madness Returns, etc., my notebook shuts down automatically and when I re-open my system, it returns to last stage of the game when it was closed. This problem did not happen earlier. Please provide a quick solution so that I can play normally.

Samrat Nandan

A Are you getting a blue screen while you are in the middle of the game? If yes, then the system's HD graphics are falling short while playing the game. You will have to lower the settings on your games to see if you are getting a stable system performance.

Q System heating up

I own this old Compaq Presario C702TU and it's heating up to temperatures as high as 80 degrees C. It stays at that temp for a long time, I tried to increase the fan speed using utilities such as Speedfan but it won't detect the laptop's fan.

Stephin John Thomas

A Get the laptop looked at by a service centre as 80 degrees is terrible. Stop using it immediately, it's already a miracle that your motherboard hasn't been fried. It seems to us that your laptop fan has just stopped functioning totally.

Q Card not being recognised

I had a memory card on which I copied some movies and files from my computer. But when I connected my memory card to my laptop to

copy those movies and files then it showed me a message that said, "You need to format your disk." I don't want to format my memory card at any cost, so please kindly help me to resolve this issue.

Shashank Shekhar

A Did you copy or move those files? Does the card still read on your computer without asking for formatting? The file allocation table might be corrupt, or you may not have "Safely removed" the card.

If it doesn't read on the computer as well, some corruption has occurred and you'll need to format the drive. You can try using a data recovery software, such as Recuva, to recover the files if they are very important, but this will take a considerable amount of time.

Q Windows detected a hard disk problem

I got a strange error message that popped up while I was browsing the net (given below). Before I do anything about it, I want to be sure that it is legit and not someone's attempt to get me to install a virus or something like that. And if it is legit, I want to know what I should do about it.

I am running Windows Vista 64-bit, and the hard drive in question is an internal Toshiba 500GB drive.

Please help me in resolving this tricky issue as I don't intend to format my hard

drive which has my precious software and data.

Lunthang Tonsing

A Are you hearing any knocking/scratching sound from your HDD while your system is running? If yes, the HDD is facing some mechanical issue, and the best thing to do is back up all your data.

If your hard drive is running fine, then you should run through the following steps. Go to Start>Run>gpedit.msc

Under Local Group Policy Editor navigate to Computer Configuration > Administrative Templates > System > Troubleshooting and Diagnostics > Disk Diagnostic

Double Click on "Disk diagnostic: configure execution level", set it to "disabled". "Not configured" is enabled by default. Then restart your system.

Q Socket pins damaged

I am a regular Digit reader. I have a problem related to my Motherboard socket

The problem is that my socket pins are broken and I want to fix these broken pins

My computer specifications are

1. Processor: Intel Pentium E5500
2. Motherboard: Gigabyte G41mt-es2l
3. RAM: 4GB DDR3
4. HDD: Seagate Barracuda 500GB
5. Graphics Card: MSI N430GT

Please tell me how I should go about it.

Siddharth Gupta

A Are the pins broken or just bent? If they're broken, you will have to get a new board or you risk damaging the CPU and in extreme cases, fire as well.

If they're bent you need to have a steady
