

India's surveillance program

GOI has reportedly launched its own surveillance program giving itself authority to track phone calls, text messages and posts. <http://dgit.in/11AoPkA>

Smartphone users distribution

Check out these amazing maps showing distribution of iPhone, Android and Blackberry users in some major parts of USA. You'll be astonished! <http://dgit.in/195hqIT>

Workshop

- Similarly, draw the nose and then use Grab tool [G] to pull the nose outwards, trying to get the exact shape of a human nose. Then run Smooth tool [B] over this spot to smoothen it out.
- Select Crease tool [E], untick Invert and run it over an eyebrow to make it look more realistic.
- Make a base ground for the eyes by digging a shallow hole in the shape of the eye below the eyebrow using Draw tool [D] with moderate strength and Invert ticked.
- To make it look like an eye, extrude this base ground slightly using Draw tool [D] or Grab tool [G]. If it appears sharp, smoothen it using Smooth tool [B].
- Now go back to Draw tool [D] and extrude a curve below the nose. This will create a broad lip.
- To split the lip into two, take Crease tool [E], tick Invert and run it along the central axis of the broad lip.
- The lips may look sharp, in which case you'll need to run Smooth tool [B] along their edges.
- To create nostrils, take Draw tool [D], tick Invert and dig a hole into the bottom of the nose.
- Now using Draw tool to pull out the clay to make an ear. Then switch to Flatten tool [F] to make it flat.
- Select Draw tool again, tick Invert, set strength to maximum and dig a cavity into the ear to make it look more realistic.
- If the cavity looks rough, run Smooth tool [B] over it. That's it! Now that you've been introduced to most of the tools and their practical uses, let's move on to something more advanced.

Modelling and painting a cartoon character

Let's start making a model of 'Patrick' from SpongeBob SquarePants. It's easy and you'll have fun making it. Firstly, download a reference image from <http://dgit.in/16Xqjd0>.

Modelling

- Keeping the symmetry tool checked, let's start by making the head. As you notice, it's a starfish, so you'll have to taper the clay by extruding it

upwards. Use Grab tool [G], set the brush size to maximum and pull the clay from upward. It will look like a water droplet.

- Now, to draw the hands you'll need to turn the camera view to 'Left'. Then use Draw tool [D], set the brush size and strength, position the brush at the center of the clay and click several times. This will extrude the clay outwards easily.
- The extruded portion will be straight. You'll have to bend it downwards to make it appear like hands. Turn the camera view to 'Front' and pull the hands down with Grab tool [G] shaping them like the character's hands (refer to the reference image). If the hands have an uneven surface, run Smooth tool [B] over them.
- To make the legs, use Grab tool [G], set the brush size and strength and pull the clay at the bottom downward.
- You're done with the basic modelling. However, it won't look like 'Patrick' until we're done with its painting. Painting will add details to the model.

Painting

- To start painting, click on Paint button > Choose 1024 or 2048 resolution > OK.
- Since our character's body is pink, that's the colour you'll choose under Draw tool. See the reference image and try to get the exact colour.
- After selecting the colour, click on Fill tool [F] to get the pink on the entire body.
- Now, select Draw tool, choose the white colour, set the brush size and hardness and draw the eyes. Then, reduce the brush size, choose black and draw the border of the eyes as seen in the reference image. Similarly, draw mouth and pants as well.

Advanced Painting

What we did till now was basic painting. Now, let's get to its advanced stage. It's a complicated process and you'll require slight knowledge of Photoshop.

- Click on Show advanced tools > Export PSD > Save it.
- Download 'Patrick Eyes' image from <http://dgit.in/14dTqWI>

Basic modelling of the body

Using Photoshop to paint the pants

And voila! Patrick Star

- Open the PSD file in Photoshop. You'll see three layers: 'bump', 'shade' and 'paint'. We'll be working on paint layer only. Insert the 'Patrick Eyes' image into this layer and position it as eyes. Save the PSD.
- Return to Sculptiris and import the same PSD. The eyes will appear on the model.
- Now, select Draw tool, press [C] and click on the pink in the image. It will pick up Patrick's pink colour on the brush. It's important that you maintain colour consistency. Colour the rest with the same colour.
- To paint pants, export the PSD again, download the 'Pants' image from <http://dgit.in/12U6Hr0> and follow the same Photoshop procedure again. Then, import the PSD file in Sculptiris. Your final model will look like the image above. That's it! Enjoy experimenting with Sculptiris.
