

The Intel App Dev Center

mobile, or you can choose to package it as a desktop app in the form of a WebApp. Actually, even Facebook and Chrome are available as a valid choice for target platforms. If however, you choose to integrate with something like Facebook or Google, the XDK does provide an option to enter the credentials related to the configuration of such platforms if you click the Credentials button on the top right. The app dev center allows you to perform test builds as well as actual builds, so that you can download and publish the app to the respective app store directly. Though, you might have to provide certain details first, which for example include the Project ID, API Key in the case of an Android app and probably other obvious details related to the application such as icon, version number, title etc. Once you are done, you should be able to see a big green Build your app now button which indicates that all the required settings are in place for a build to complete. Once the build is completed, you
