## Halo: Spartan Assault

Halo: Spartan Assault, the next Halo game is coming on Windows 8 and Windows Phone 8 devices this month <http://dgit.in/10PFbZP>

able, particularly when the integrated mount means there isn't much gap between the glass and the device.

When you pick up the MapmyIndia Vx140s Premium, you immediately realize that you are holding one of the higher-end devices, and the build quality reflects that. Its design is as clear as daylight. True to its price tag, the Vx140s Premium feels well put together. We had said this last year, and we will say it again – among all conventional GPS navigators, the Zx250 is by far the most premium-feeling navigator from MapmyIndia, and indeed among the competition. Its warm grey colour finish is unique, particularly when most other navigators are sporting various shades of black.

The Garmin nuvi 2568LM carries forward the design elements from the nuvi 2565LM, which won the Best Performer award in last year's GPS comparison test. The newer 2568LM's form factor remains exactly as its predecessor's – apart from a minor change, look wise. The device's frame around the display now has a glossy black finish, while the rest has a soft-touch finish.

**The navigation tablets:** Along with tiny GPS devices, there are two tablets in the test as well, with the MapmyIndia CapPad 5 and the Primo GPS PG711G. The former has a 5-inch screen, making it just bigger than a conventional GPS device. The latter, the PG711G offers a complete tablet experience, with a 7-inch display. Both devices are rather unique in their own right, but the Primo PG711G has the advantage of a more wholesome experience. But, the CarPad 5 does offer a slicker interface, which is something the PG711G lacks. However, both devices running

MapmyIndia maps, the PG711G offers a bigger display to see the landmarks on. Both are built very well, and can be used elsewhere as well, and are not just restricted to that windshield mount!

## Of windshield mounts

An important piece of a device's build quality is the quality of its windshield mount. Let's see how different products fare in this aspect.

**Satguide:** The windshield mounts from Satguide are a bit of a mixed bag. Setting up has an additional step, since there are two pieces that need to be joined before the navigator is snugly fit. While it is a good idea to have

**Primo GPS:** In a change from last year's edition, the windshield mounts on the PG411G are much better. Gone is the two part setup, instead there's something that is a worthwhile piece in itself with two elbows for height and side angle adjustment. The mount also neatly houses the stylus. All in all, a very well done effort.

**MapmyIndia:** The mount design remains largely similar as last year. It is also a two-piece setup, and literally has no chances of screwing up, since the one place where you tighten it won't ideally get loose. Fit the mount holder on the device. Attach the mount arm into the first part, and tighten

dock the device on it and mount on the windshield. You really don't need to spend any time setting it up! Furthermore, there is a mini USB, a micro USB port and a video-in on the mount itself. The navigator remains very stable on this platform, even on roads that aren't the best to drive on.

**TomTom:** This is, on paper, the simplest mount of all. As we had mentioned, it is a very neat idea, and we think this is something all GPS/PND device manufacturers should consider. However, the implementation needs to be slightly improved. We say that because the devices tend to vibrate quite a bit as you drive along. Also, the TomTom devices have the habit of falling off the windshield on a bumpy road, if the suction cup is in anything less than perfect condition. However, this minimalist design means you can even install it on the dashboard, depending on the material of plastic in your car.

## Maps & navigation performance

This is where we look at the performance and the usability aspect of each device, and see how each performs individually and in comparison with the rivals.

**Garmin:** Last year, the nuvi 2565LM was by far the best navigation device as far as map clarity and navigation precision was concerned. This time around, the updated nuvi 2568LM just takes the game further. The navigation quality is very good, be it on the main roads, a national highway or roads inside a housing colony. The lane guidance feature really works well on main roads, so much so that it will periodically

MapmyIndia Lx340

complete flexibility in terms of height and angle but the device's tightened screws get slightly loose after some time, particularly for the arm that handles the face angle of the navigator – especially after a ride over bumpy roads. While there is no risk of the devices falling off, you may need to tighten the screws every few days to ensure they don't loosen up completely.

once you have set the angle. Now attach it to the windshield! But it doesn't get lot of points, since joining the dock to the arm is a time consuming process – you cannot really set an angle for it unless you use the trial and error method in the car itself.

**Garmin:** Probably the most solid looking mount that is quite literally a single piece one. Just
