

New typing experience

Google Keyboard is a Nexus-like keyboard with amazing features available in Play Store for any Android 4.0 and higher phone or tablet. <http://dgit.in/13HebdC>

Dropbox update

Dropbox users can now share the Dropbox links right from their desktop. Check it out <http://dgit.in/177mntQ>

Ritzy Smartphones: THE ONE WORTH YOUR MONEY

The year 2013 is just half done with, but a lot of rather chic smartphones have been launched. We attempt to sift through all the options, to reach what we believe, is the best phone money can buy.

Vishal Mathur

vishal.mathur@thinkdigit.com

The first six months of the year 2013 have been nothing short of a revelation. The kind of variety that usually gets launched across 12 months in a calendar year, has been cramped within just 6 months in '13. And with half of the year still remaining, we cannot be more excited for what smartphone marvels are still under wraps. Here we compare the top smartphones from various brands.

BUILD & DESIGN

One thing about this bunch of devices is very clear – the popularity of touchscreen phones is pretty much sky high at the moment, with only the BlackBerry Q10 being the phone with

the good old physical QWERTY keypad. Let us go through each device one by one.

Google Nexus 4 by LG:

All that glitters...

The Nexus 4 by LG made its way to India rather belatedly. The device does elicit passionate oohs and aahs from fans, but for the rest, it looks pretty much like any other smartphone. However, the real goodness of this unibody design can be understood only when you use the phone in detail. Its front has an unassuming design, with the screen and touch-sensitive keys sitting below it, pretty much the trademark of Android phones. However, flip the LG Nexus 4 over, and the glass back awaits you. The holographic design

on this glass glimmers under light. Two things that need to be specified – 1) The iPhone 4 and the 4S had the glass back for years and 2) This gets scratched very quickly. However, if you get beyond the idea of “No, I will not put a case on my Nexus because of its back panel”, and actually get a bumper case for it, the device will have a better chance of staying intact longer, as is the case with most smartphones. Very good form factor for single hand use, and despite looking rather bland at first, has a finesse about it that most Android phones sadly lack.

LG Optimus G:

Why, LG? Why?

As far as the specifications and the innards are concerned, the Optimus G is almost exactly

like the Nexus 4. But design-wise, it is very different. Its industrial design with less curves and a little less polish in terms of smoothness is disappointing. While the Nexus has the cascading effect where the display glass ends and meets the body, the Optimus G has a very rough. While it has glass on the back, the Optimus G neither has the finesse of a Nexus nor does the imprint really glitter that well when light falls on it. The camera sits slightly higher than the rest of the panel, and the phone when placed on a table, sits on it. This is a design flaw that is pretty silly, and a lot of manufacturers tend to overlook this when designing phones. When LG can make the Nexus 4 what it is in terms of the brilliance of
