BlackBerry Q5 is the latest BB10 smartphone to be launched in India, and is closer to affordability than the first two phones have been – the Z10 and the Q10. Sporting the looks of a conventional BlackBerry, with the trademark QWERTY keypad, and a 3.1-inch capacitive touchscreen, and is meant simply to appeal to those who can't afford the more expensive Q10.

The build quality and looks of the Q5 don't feel "affordable" in any way. Yes, the phone is all plastic, but the materials used are very high quality and it's well put together. Strangely, the QWERTY keypad feels less harsh and much better to use than the more expensive Q10's keypad. The key design is flatter this time out, and follows more on the path of the Curve series of smart-

phones. (The Q10 followed the design from the Bold series' keypad).

The touchscreen works well, touch input is good, and so is its overall brightness and text readability. The square aspect ratio means you will find this more comfortable for viewing documents on, offering a drawback on media playback sessions. Battery life is quite acceptable, lasting anything between a day and a day and a half, varying according to different usage patterns, of course.

All in all, the BlackBerry Q5 is a nice phone but it's meant for a specific user base. The phone doesn't feel cheap or basic. We only wish for its price to reduce (probably below 20K) as that would widen the appeal of this smartphone tremendously.

Samsung Galaxy Mega 5.8

Bigger doesn't mean better

The Samsung Galaxy Mega 5.8 is a really big smartphone. That would have been ok if the package on offer was good. The design is the same as any other Samsung smartphone/phablet – plastic body, glossy and a fingerprint magnet. On its own, the display of the Mega 5.8 looks ok, but compare it to the resolution and pixel density on offer by the competition and you won't be impressed with it. Since the display is large, you also have access to one-hand operations such as keypad and in-call buttons, calculator and more.

The smartphone comes preloaded with a bunch of apps such as the S Memo, S Planner, S Translator, S Voice, S Travel and the Samsung App store, a bunch of features that we have started seeing on Samsung devices from the days of the SII and the Note II.

₹24,900

Games such as Dead Trigger stuttered on the device when the action got pretty intense on screen. Natively the Samsung Galaxy Mega 5.8 recognised MP4 without any issues. It refused to recognise AVI and it recognized the video in the MKV videos but not the audio. You can however run all the audio and video formats on the device through third party apps.

It's difficult to recommend the Galaxy Mega 5.8. Sure it has a good camera; works well as a phone, but the display and build of the device are lacklustre. If you want a device with a really large display that isn't the Galaxy Note II, you should consider the Galaxy

Mega 6.3 or the Ascend Mate. *Follow the instructions on page 108 to get more out of this review.*
