BlackBerry Q10

The luxury keyboard model?

The BlackBerry Q10 is currently the most expensive BlackBerry there is. Does that mean it's their flagship model? Probably not, because the Z10 is more a mainstream phone, and this is a more targeted device. In fact, BlackBerry probably expects it to sell less than the Z10, but since they had to develop and re-program a lot of things to get a hardware keyboard to work with an OS built for touch, you're going to have to pay a premium for it.

The keyboard on the Q10 is laid out in very geometrically correct, straight-lines. There's no upward curve to the keys like on previous BlackBerrys, and there's no optical trackpad, Menu, Return and call and disconnect buttons either. However, this is still one of the best typing experiences you can get in a current generation phone, so BlackBerry has certainly lived up to their reputation in that respect. The keys are backlit, and sculpted perfectly for those who use both thumbs to type.

At a size of 119.6 x 66.8 x 10.4 mm, this is a small-ish phone that sits firmly in your hand, and at 139 grams, it's just the right weight. It's a good-looking phone, and has the feel of a premium device – it has a metal frame and four additional metal struts for additional support (three in front and one behind). We dropped the phone inadvertently a few times, and there wasn't a scratch to be found.

With a 2100 mAh battery, the Q10 will get all but the super-heavy-duty users through a day of use. It has a micro-SIM slot and a micro-SD slot for additional storage – up to 32 GB according to BlackBerry, but 64 GB cards formatted in FAT32 will also work. You'll need a class 10 card if you want the phone to stay zippy and also want to shoot 1080p videos. Speaking of the camera, there is an 8 MP shooter on the back and a 2 MP shooter on the front for video calls. Camera quality is excellent if you shoot in the day time / well-lit conditions, but leaves a little to be desired in dark settings. There is an LED flash, but that's only good when the subject is close to you. The camera

has a Time Shift mode to click and adjust the faces it detects, so you can make sure all subjects have their eyes open in the shot.

The phone's powered by a dual-core 1.5 GHz Snapdragon CPU, Adreno 225 GPU, 2 GB of RAM and 16 GB of internal storage. The display is a 3.1-inch, Super AMOLED, 720x720 pixel, 330 ppi beauty, so you get a weird 1:1 aspect ratio.

Videos and browsing are a little bit of

a pain on such as screen, but text is super readable, as we've come to expect from all BlackBerrys.

Flash support means you can view any video that's online, but we found older 4:3 ratio videos look a lot better than newer 16:9 ones. Browser performance is top-notch, but you will have to use the Reader mode to really read a lot of text online, or else scroll a lot because of the small screen.

Because of the hardware keyboard, shortcuts such as [T] to go to the top of a list, or [B] to go to the bottom still work. However, there are also command shortcuts – type “call xyz” and press Enter, and you're calling XYZ. You can also

use “tweet <message>”, “email XYZ”, “bbm XYZ”, “text XYZ”, etc. The bundled earphones are of a higher quality than the ones we got with the Z10, and the speaker is pretty decent – loud and clear (for a phone). Call quality is actually better than the Z10.

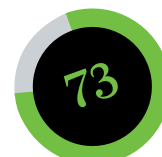

In terms of apps, the BlackBerry 10 platform is new, so they're sparse right now, but all the important ones you're likely to use are bundled with the phone. Since maps don't work well in India, you get MapMyIndia free, courtesy BlackBerry, but make sure you buy your phone from an authorised retailer, or else it might not work.

At an MRP of ₹44,990, (MOP of about 43K) it is really hard for us to recommend this phone to anyone but a BlackBerry loyalist who wants a great keyboard, is willing to give up screen size to get it, and has a big wallet. If you just want QWERTY goodness the Q5 is probably a sweeter deal, and if you like touchscreens the Z10 will keep you happier.
