

Moto X spotted

And in the hands of none other than Google's Executive Chairman, Eric Schmidt. Of course he made no attempt to hide it.

Social media overload

A new study conducted in the US reveals 50 percent internet users suffer from social media overload

influence and benefit. Participants can shape the evolution of software platform early in the release development process through code contributions with no restrictions on applications or services under an open governance model.

- Innovation and Differentiation – a robust core OS platform frees OEMs and service providers to focus on innovative, differentiated solutions and value-add services. Enables business freedom: your own brand strategy with apps, services and a fully customizable UX. Tizen will also offer compelling, global developer programs to incent app creativity, further enhancing the user experience.
- Industry support – consolidation of the LiMo and MeeGo efforts will amplify and broaden the level of ecosystem support, in particular by service providers who are essential to pave the way for successful device introductions and product acceptance by consumers.

The key differences are Tizen's comprehensive, standards-based HTML5 application solution and even broader industry support.

Members of the Tizen Association represent every major sector of the mobility industry and every region of the world. Current members include OEMs Samsung, Fujitsu, Huawei, Panasonic Mobile Communications and NEC CASIO Mobile Communications; operators KT, NTT DOCOMO, Orange, SK Telecom, Sprint and Vodafone; and Intel. For more information, please refer to their web site.

4 When you compare India to the rest of the developed markets, what gaps do you see from a developer ecosystem point of view? What steps are being undertaken by your team to fill some of these gaps?

Indian developers are very talented and are fast learners. Indian developers have produced great software solutions for Enterprises of the world over the last few decades and will continue to do so. However Indian developers need to apply this strong background to evolve equally great consumer applications. The Indian developer need to focus on App

“Today the developer dimensions are evolved to add more vectors which include Cross Platform development needs, User Experience, App monetization, increased use of Cloud services and application security”

User Experience for a wider audience, Innovation for local markets and think about new ways of monetizing applications. Indian developers tend to focus on quantity than the quality of the business model of the applications.

Intel is trying to help the Indian developers by providing them training on the User Experience and how to improve on them. Intel also offers mentoring support during app ideation and also rolled out multiple contests to highlight new usage models and innovation.

Intel has provided easy software tools which allow the faster time to development on stacks such as Android and HTML5 ensuring that the developers think more deep for the business value of the application and monetize it.

4 What programs does Intel run (or plan to) to further development and developer communities in India?

Intel is working on educating young and professional developers on the platform technologies and capabilities of Intel which can result in innovative applications and business models. Intel is offering focused trainings through various events, webinars and community meet ups.

Intel is also investing in hardware seed systems to allow the developers to use the new Intel technology for application development. Intel has been working with Indian software developers over the last 8-9 years to make them aware of possibilities of parallel programming.

Intel is also recognizing the community contribution from Indian developers by a Black belt program which allows developers to get visibility and expert status recognition.

Intel will be promoting its developer program to Indian software developers

and will provide access to software tools, SDKs, training and community support. The developer engagement is also happening through various social media properties of Intel Developer Zone including Facebook, Twitter and YouTube content channels.

4 Recently Intel combined its efforts and energies from being diverted across Intel Software, Intel App Up, etc to form a consolidated presence on Intel Developer Zone. What were the learnings that led to this move, and what should developers in India look forward to from IDZ?

The Intel® Developer Zone is a global program for the software community that offers insights, information, expertise and tools to help drive innovation and success among developers. The program gives members the opportunity to connect and collaborate, share knowledge, learn and grow professionally. In addition, members have access to a wide variety of opportunities to market and sell their software and apps directly to consumers and tap into opportunities to help them grow their businesses. The Intel Developer Zone is designed to create value for anyone involved in creating and selling software that's used on Intel-based devices and differs from other software programs that focus on a particular subset of software. Other resources that communicate and share new ideas with developers include Intel® Software Adrenaline program and The Parallel Universe quarterly magazine.

Providing a one common program helps Intel to address software developers and partners in a more coherent way and helps to connect and collaborate more effectively. The Intel Developer Zone communities are now able to explore content and software tools from various Intel® groups and are able to take an informed decision without a need of searching individual sources. The Indian developers have seen a great value in the Intel® Developer zone and which has been substantiated with increased traffic and engagements from Indian developers on Intel® Developer zone 4
