

Security Watch

A look at the various developments that have the potential to affect our privacy and security

that “We’ve changed a few things”, but we assume this will soon highlights apps and other content.

Google Maps has been given a new interface that’s available to all users. The updated interface has deeper Google Earth and Street View integration, and is in line with Google’s other services. The new Google Maps lets you draw a tailored map for every search and click you perform. Google has also made Maps more interactive. Clicking anywhere will focus the map on that location and show you helpful things, such as related places and the best ways to get there.

Google says the new Maps gets better with use. “As you search the map, star places you like and leave reviews, the map starts to adapt and can suggest things like restaurants you might enjoy or the quickest way home. In other words, the more you use the new Google Maps, the more helpful it becomes,” says Google.

Facebook ordered to put ‘No under-13s’ disclaimer

The Delhi High Court in July took a serious note of children below 13 years having accounts on social networking websites.

The court has asked Facebook to put up a disclaimer on its home page stating that children below 13 years cannot open an account on the social network. The Delhi HC also rapped the Indian Government for not having adequate laws to prevent children from being abused on social networks.

“You (Facebook) can write on the home page in bold letters that children below 13 are not allowed. There is no harm in doing this...,” the court said. The court also asked the Centre to provide detailed information about what laws are in place to

protect children online. Good move, we think.

“In India what is the law for a minor to use Facebook? Is it 13, 16, 18 or no law? What is the requirement under Indian law for Facebook?,” the court noted after the central government’s counsel mentioned that in the U.S. children above 13 years are

Facebook has been asked to disallow children under 13 years old from joining the social network

allowed to join social networks. “You don’t have a law for protection of minor on social networking sites? You are behind the time...the world has gone

and was educated at St Paul’s Girls’ School. She excelled in fields of science, Latin and sports. Later went to King’s College, Birkbeck College in London and did her PhD degree from Cambridge. Franklin died at the age of 37 in 1958 of ovarian cancer. After her death Rosalind’s work received recognition from several colleges and universities.

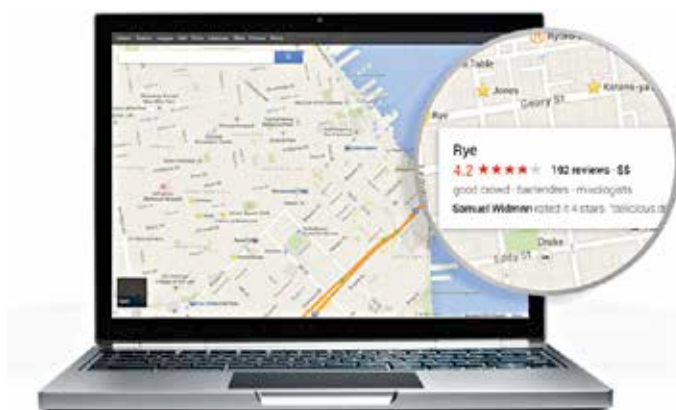

The discovery of DNA’s structure helped Franklin’s co-workers understand cell metabolism and genetic information which has led to significant progress in medical science. Franklin’s studies have also helped in the understanding of the molecular structures of RNA, viruses, coal and graphite. Franklin also led pioneering work in the fight against tobacco mosaic and the polio virus.

Various controversies came to light following Rosalind’s death. Franklin worked at King’s College London where she conducted her DNA research under Maurice Wilkins. She was not nominated for Nobel prize for Chemistry which was subsequently awarded in 1962 to Crick, Watson, and Wilkins, her co-workers, for their DNA study. The trio later acknowledged that they had used Franklin’s images to formulate the hypothesis regarding the structure of DNA. 

Google celebrates DNA scientist Rosalind Franklin’s 93rd birth anniversary through a unique doodle

The web search giant paid tribute to noted biophysicist, Rosalind Franklin, with its Google Doodle today. Franklin is known for her work on the X-ray diffraction images of DNA which led to the discovery of the DNA double helix. The Google Doodle shows an illustration of Franklin looking at the double helical structure of DNA with an X-ray.

Rosalind Franklin, was born on July 25, 1920 in Britain. Since childhood she showed exceptional scholastic abilities
