Xperia Z Ultra

Sony announced Xperia Z Ultra – the big brother of Xperia Z with 6.4-inch screen, 2.2GHz Snapdragon 800 CPU and 2GB RAM <http://dgit.in/1aKifid>

Behold the HTC One Mini

some of the same specifications. The Q5 is 10.5mm thick, and weighs in at 120 grams. The Q10 is slightly thinner and heavier, at 10.35mm and 139 grams. Both, the BlackBerry Q5 and Q10 bear 3.1-inch 720x720 pixel 329 PPI displays (though the Q5 has a TFT LCD display instead of the Q10's Super AMOLED), and have 2GB of RAM and 2MP front-facing cameras.

This is where the similarity ends however. The Q5 has a slower dual-core 1.2GHz Qualcomm Snapdragon processor powering it instead of the Q10's 1.5GHz, 8GB of built-in storage instead of 16GB, and a 5MP autofocus camera with LED flash instead of 8MP.

HTC One Mini now official

HTC has announced a mini version of its flagship smartphone, HTC One, called the HTC One Mini, which has been doing the rounds of the rumour mill for quite some time. The device will go on sale starting this month.

As the name suggests, the smartphone is a little sibling of

the flagship HTC One in terms of its looks, design, performance and certain features, such as the IR Blaster. To start with, the HTC One Mini has a 4.3-inch 720p display giving it a pixel density of 342ppi. The display is S-LCD2 and is protected by Corning Gorilla Glass 3. The One Mini is powered by a Qualcomm Snapdragon 400 chipset with a dual-core Krait 300 CPU clocked at 1.4GHz, Adreno 305 GPU and 1GB of RAM. It has 16GB built-in storage and there's no expansion option via a microSD card.

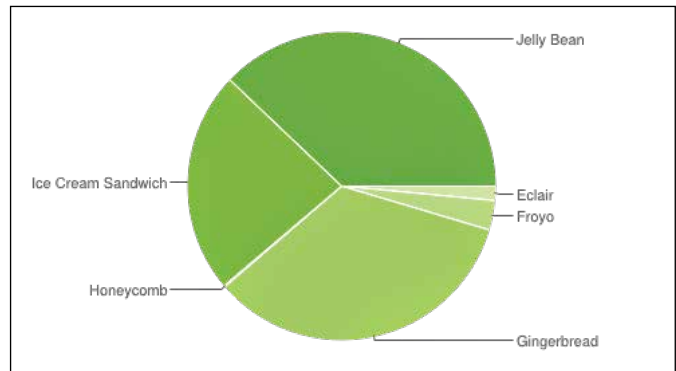

The One Mini runs on Android 4.2 Jelly Bean and has the HTC Sense UI version 5 overlaid on it. You get access to HTC's BlinkFeed and the smartphone comes preloaded with Beats Audio technology. The Mini retains the same aluminum unibody design of the HTC One and also houses the 4MP Ultrapixel camera, however without optical image stabilization. It has an LED flash and can still shoot HDR images and video in 1080p. The front of the smartphone has the 1.6MP camera for video chatting.

The One Mini is quite slim measuring a mere 9.25mm in thickness and weighing a mere 122 grams. It has an 1800mAh battery, which HTC claims will last for 20 hours, 40 minutes of 2G talk time and 13 hours, 20 minutes of 3G talktime.

The HTC One Mini will be available in grey and black, and start shipping in August for roughly €449 (approx. ₹35,300). The HTC One Mini is a direct competitor to the Samsung Galaxy S4 Mini.

Jelly Bean finally beats Gingerbread

Last month, Google reported that Android Jelly Bean's (versions 4.1 and 4.2) adop-

Jelly Bean is currently very popular among Android users

tion has finally surpassed that of Android 2.3 Gingerbread, making it the most used Android operating system on the planet right now, from figures based on the number of users visiting the Google Play Store. About time, considering everyone from your cousin to grandmummy is on a Jelly Bean smartphone.

The data was collected based on Google Play Store usage over a two-week period ending July 8. The new update will be helpful to developers in targeting users who utilize Google Play, and their Android devices, actively.

According to Google, 37.9 percent of Android users now use Jelly Bean devices. While 23.3 percent users have ICS devices, 34.1 percent are stuck with Gingerbread, and 3.1 percent have Froyo. Hopefully, the quicker adoption rate will continue in the near future with the release of Android 4.3, and we're counting on OEMs to roll it out quickly on supported devices.

India becomes 3rd largest smartphone market

According to a July report by Strategy Analytics, India has pushed past Japan to become the world's third largest smartphone market in Q1. China and the U.S. remain the top two global markets and the report

noted that this is the first time India has moved up to the third place. If we've read the signs right all this while, with the explosion of smartphone users in the country, then this announcement was coming, and no surprise.

The SA report documented a 163 percent increase in sales of smartphones in India in the first quarter of 2013, compared to the average 40 percent growth globally in the same period. The report confirmed that this increase is due to the improved distribution system of Samsung, Apple and Micromax.

Although Samsung and Apple remain the most sold brands, the report revealed that it is Indian brands such as Micromax, Spice and Karbonn that have led to India's increase in the global smartphone share – proud patriotic moment for all of us, just to stay in tune with the flavour of the month. These Indian brands have grown at a rate of 200-500 percent annually, with some, like Lemon Mobile, reporting a tremendous 1,000 percent growth.

The report stated that India's growth is not unexpected due to its developing status, wealthier middle class, and increased interest in consumer electronics paired with smartphone saturation in Europe and Japan. Let's reach #1 in record time, eh?
