

chunk of income to the crash in the PC market this year. Intel's quest for power, literally, resulted in more power efficient chips designed by ARM stealing a march on them. Intel is seeking to correct this error though and if their current generation of processors are anything to go by, they're on the right path."

ARM

"Of all the families that we've gone through so far, this is the most staid and boring of the lot. Yet they have done some exciting things. The family was formed with the blessings and resources of the Apple family and Acorn Computers Ltd. The family does only one thing, design and license RISC-based CPUs. It does this job so well in fact, that 98 per cent of the world's mobile devices run on ARM architecture. Sadly, for a family with their CPU in the hands of literally every single human on this Earth, a family that has shaken a giant like Intel to its foundations, it doesn't really earn as much as it should."

Samsung

"The Korean connection, this South Korean family is very powerful. It has spread its wings far and wide and is all-pervasive in the lives of the general populace. It's also the oldest family here. The family has businesses in shipping, construction, insurance, mobile phones, televisions, home appliances and almost any field that you can think of. It's so widespread in fact that it's almost impossible to figure out its true power and reach. Don Kwon Oh Hyun has been pivotal in directing the efforts of this giant family and despite a few rough patches, the most notable being Apple's claims of copyright infringement, the family has survived almost untouched. If we were to say that most of the world runs on Samsung's hardware, we wouldn't be wrong."

Amazon

"Don Bezos is a genius, a mastermind, a man of extreme intellect and he is the man who made online shopping cool. His creation, amazon.com, is the world's largest online retail store where he literally sells almost everything that a human being could want. He started off selling books online, a service that grew in popularity overnight, and later went

on to sell his greatest creation (after the website), the Amazon Kindle. This one device redefined the reading experience forever and the world hasn't looked back since. He's stepped on toes, run entire publishing houses and stores out of business and looks to be doing the same with all forms of retail. He might even succeed. This is one man that we need to keep a very close eye on."

Google

"Sergio Briatori and Lazzaro Piaggio's brainchild has taken over the world. In this digital age the Internet is the world and when 84% of all internet search comes to one website, that website runs the world. But it didn't stop there, Google went from a "mere" search engine to e-mail, Internet video, Android- the OS that revolutionised the mobile world, and other than an exhaustive online retail, provides just about every service that it's possible for the Internet to provide.

This family hasn't always played fair though and it's been investigated numerous times for "fixing" search results, surreptitiously bumping out competitors in their infancy and plotting to take over your lives, not to mention any number of copyright issues. Google has always maintained its lead due to their adaptability and the quality of the service that they provide."

Adobe

"As with ARM, this is also one of those families that has focused on one thing and one thing alone, and mastered that one thing to such an extent that there is no significant competition. Adobe has almost completely taken over the digital image editing and publishing space and is way ahead of the competition. However, unlike ARM, Adobe fully intends to make as much money as it can off its suites. The pricing policies are exceed-

ingly monopolistic and there's nothing anyone can do about it (sigh).

That said, Adobe's monopolistic pricing and policies are heavily frowned on by the world, but Adobe doesn't care. The family had also come under heavy fire from Apple when Don Stefano publicly decried Adobe's beloved "Flash" platform (to settle a long-standing grudge it's believed). Both families have battled each other many times in the past, most notably over the type of fonts that were developed at the time such things were being standardised."

Sony

"Whatever one may say about Sony, its tryst with music and media began way back in the early 1950s when boss Masaru Ibuka founded the family in 1946 and sold their first radios in 1955. The family lost a lot in the recession in the 1980s, but managed to regain ground when it entered the hotly contested media market by purchasing CBS Records and Columbia Pictures. The family also went on to produce some blockbuster movies, including Spiderman and Men in Black. Sony's attempts at entering the home entertainment market have met with a mixed response. While they arguably have among the best TVs in the world, their TV business hasn't been profitable in more than 8 years. Their smartphone and PMP divisions have also suffered a similar fate, managing to sell well initially, but losing a lot of ground later on. Somehow, Sony has failed to enter that special era that most families enter, a period when all they touch turns to gold."

The eldest watched the last slide fade from the screen as the Consigliere turned off the projector and turned to face them, adjusting his spectacles on his long, skinny nose and favouring each of them with a keen, searching glance.

He knew his Father was sick, he was worried for his health, but he also knew that this digital journal meant a lot to the Don. He wanted them to learn something, something important. He pondered deeply for a few minutes. Somehow, the general populace were the key. You had to win them over. Then it hit him, and he muttered to himself, "I'm gonna make them an offer they can't refuse!"
