Apple dev site gets hacked, shut

Late July, Apple's Developer site was shut down after it was found to have been compromised. This closure, according to Apple, was a precautionary measure.

It was not immediately clear what data, if any, was compromised by the attack. Apple said in a notice that names, mailing addresses and emails may have

been accessed by unknown attackers. It added that "sensitive personal information" was encrypted and could not be accessed.

Security experts said Apple's brief statement made it difficult to assess the severity of the breach. "I am not exactly sure what happened. I do not know what to make of this,"

said Charlie Miller, author of the iOS Hacker's Handbook.

Miller said he received an email from Apple warning him about the breach, adding that he hoped none of his personal information had been compromised in the recent attack. Still, he said he had not seen any indications that suggest other attacks on Apple could soon follow. "I don't think this indicates any system problems in their security," he said.

Data breaches are relatively common because hackers are constantly identifying new ways to attack by exploiting software bugs and leveraging mistakes in the way companies configure websites and computer systems. Hackers are also relentless in sending emails with malicious links and attachments to targeted companies. >
