

In the sample set of campaigns played, 51 per cent of the target users completed listening to the call and an additional 14 per cent listened to the call for some part but disconnected before completion. The remaining 35 per cent of people dropped the call even before 15 per cent of the actual duration of the promotional clip was rendered.

Campaign wise:

For the 10 most successful campaigns almost 73 per cent of the rural consumers completed listening to the call till the end.

Most of the voice campaigns played were between 15 seconds and 60 seconds.

In this case, the campaigns under 15 seconds received maximum completion rate followed by the ones within 30 seconds

15 seconds: In voice campaigns that were played for 15 seconds, rural consumers stayed either till the end or dropped off just at the beginning

30 seconds: In the campaigns for 30 seconds, 57 per cent stayed till the end

60 seconds: In voice campaigns for 60 seconds, 16 per cent stayed for 45 seconds and 47 per cent stayed till the end

For durations longer than 60 seconds, the call completion rate came down well below 47 per cent

These voice campaigns therefore helped the company gauge the rural customer reaction to initiatives to reach out to them. Post the analysis of the success rate of the campaign, it is evident that automated outbound voice calls are an effective way to connect with rural customers through their mobile phone. Furthermore, using local language is a necessity while conducting such activities. Lastly, a small and an informative voice campaign with the required detail is much more successful than a long elaborate message.

The study also helps us understand the effective usage of mobile devices that can aid different companies to reach out to their rural customers.

Mobile phones today are the success story of bridging the digital divide and bringing tangible economic benefits. They are agents of social mobilisation through an improved level of communication. Enterprises today should increasingly focus on adopting this device as an important communication medium to reach out to their rural customers.

For India, to become a developed nation, inclusive growth is necessary. The need of the hour is to effectively connect with the majority of our population and providing the variety of services to the consumers thus facilitating inclusive growth. >

>>Vishwanath Alluri, Founder and Executive Chairman, IMImobile

He founded IMImobile in 1999 to capitalise on the emergence of mobile data services with a vision to harness the intellectual resources of India to develop an IPR centric technology company.

With the deep resolve of developing a technology company from India for world markets, he has envisioned and evolved IMImobile into a leading international player. With a global client portfolio, IMImobile's services are available to over 1 billion subscribers in over 72 countries.

His vision is to create an Indian global technology powerhouse that alters the perception of India as a source of lower value added "services" to one in which India moves up the value chain to own its intellectual property.

He is academically a Chartered Accountant and Company Secretary. His initiative aims to democratise innovation, convert telecom networks into 'smart pipes' and unleash the creative prowess of the developer community to bring a wide range of applications and services to market. Recognizing the cutting edge technology work in this emerging technology space and the fast paced growth of IMImobile, he has been acknowledged internationally.

Industry Recognition:

- CEO of the Year - voted by industry peers at the World Vendor Awards, London in May 2011
- GTB Power 100 most influential people in world telecoms in 2010 and 2011. Global Telecoms Business is a Euromoney publication
- Named among the 50 most important people in mobile content by Mobile Entertainment (a leading Publication from UK)
- Emerging Entrepreneur of the Year, 2012 by Confederation of Indian Industries(CII).
