

Customize the look of VLC with a skin of your choice

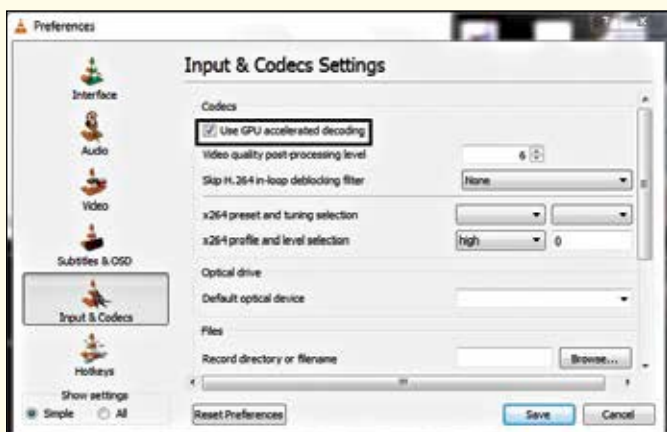

VLC lets you enjoy the highest quality of audio playback

You can also edit the toolbar with most used commands

It also supports H.264 and MKV files playback support

VLC lets you accelerate video decoding through hardware assist

Reduce CPU usage

There are a lot of complaints about newer versions of VLC loading the CPU. VLC comes with an option of hardware acceleration in which some processing is given to the system GPU to lighten the load on the CPU processor. This reduces the CPU processor consumption of VLC and allows you to run simulations, apps etc while running your media player smoothly. While this is a really helpful option it might sometimes lead to

slower decoding. Anyways for laptops with GPU hardware this is quite a helpful option for escaping choppy playback and heavy CPU usage. To enable this option go to Tools->Preferences->Input and Codecs and select the Enable GPU acceleration option.

Audio sync

Watching videos is a horrible experience when the audio is not synced. VLC has a neat option to sync audio with video. For increments of 50 milliseconds you can use the

VLC lets you accurately sync audio to video

J and K keyboard shortcuts for backward and forward increment respectively. In case you have been precise enough to record the exact amount of change required you can do the following. Go to Tools->Preferences->Audio. Select the all option in the lower left corner of the window. In the window that

follows select audio from the host of options in the left side menu. Then simply enter the time in milliseconds in the box next to Audio Desynchronization compensation.

Reduce video lagging

Old computers seem to have a problem while playing high
