

Take snapshots with ease

resolution videos and certain formats. This can be fixed by using a simple trick. Go to Tools->Preferences->Input and Codecs. In the Codec section change the setting of the 'Skip H.264 in loop de-blocking filter' from None to All and save the setting.

Reduce Pixelation

Low quality videos can be enhanced by reducing pixelation and blockiness effect. This can be done by enabling post processing option by going to Video->Post Processing. A higher number denotes a higher level of post processing. What this option effectively does is employ a filter on every frame that smoothenes the image. Hence you end up losing on image detail, but block effects are smoothened out. As this is computationally intensive, it is best applied on laptops with high processing power.

Video effects

VLC has some really cool video effects options. You can tinker around with a variety of these by going to Tools->Effects and Filters->Video Effects. Ever wondered if Yuvraj's flick six off Brett Lee would look as elegant if he were right handed? You can check that out by flipping the video horizontally using Geometric filters. Motion Blur effect can be added in real time using Advanced filters. There are loads of options for changing color, contrast, brightness, sharpness, etc.

Snapshots

Want to tell a friend about a blooper that appeared in a movie? Well, take a snapshot. Pausing at the right moment for a snapshot is invariably difficult. In VLC you can enable advanced controls by View->Advanced Controls. The right most button in the new row of buttons is the frame by frame playback button. Repeated pressing of the button will enable to play and pause your video playback frame by frame. That makes the task of taking a snapshot quite comfortable. You can take a snapshot of a frame by Video->Take snapshot. The picture is saved in the my Pictures folder of your home folder.

WEBCAM HACKS

The webcam is a useful gadget connecting people from around the world to each other. The distance between them doesn't matter as long as they have a strong Internet connection. This is, or perhaps was, the primary function of the webcam, but over the recent years its functionality has changed a bit. Nowadays, it is being used for security purposes and online video broadcasting over the internet. We have some tips for some of the coolest things you can do with your webcam.

Log in using face detection

A freeware called BananaScreen gives you the wonderful ability to log on to your Windows PC or laptop using your face. We're already familiar with this feature on Android and iOS devices. Now the same facial recognition technology has been brought to Windows PCs.

First, you'll need to install BananaScreen on your PC. Once installation is done, you'll proceed to configure your login settings. Here, you must record your own face and predefine how long your system can remain idle

This is how the output for the 3d taj mahal will look like

GE smart guide

before it's locked automatically. You can also use [Alt]+L to lock it. Now your webcam will keep looking for your face to appear, and when it detects and matches your face, it will immediately unlock your system. Cool, right? Download BananaScreen: <http://dgit.in/137ykv7>

Experience augmented reality

Before getting to this tip, you should first understand the concept of augmented reality (AR). If you've been a regular Digit reader, you might have already discovered what it means and how it works. If not, go grab our handy guide, 'Fast Track to

Augmented Reality' from the Thinkdigit website. It sheds some light on AR and related terms. To explain briefly, Augmented Reality is simply a type of virtual reality that enhances your perception by adding more information to the real world. A recent and very popular example of augmented reality is Google Glass.
